2.18.1 CAS Console Definitions

2.18.1.1 CAS.h

Development:SIMNET:MCC:CAS:CAS.h

CAS.h defines the representation of information communicated between the CAS Macintosh application and the MCC host.

2.18.1.2 CASMac.h

Development:SIMNET:MCC:CAS:CASMac.h

CASMac.h defines types, constants and routines used within the CAS Macintosh application. Table 2.18-1 describes the variables used by CASMac.h.

Variables		
Variable	Туре	Where Typedef Declared
scheduleDialog	extern pointer to DialogState	Development:SIMNET:libmac: dialog.h
scheduleField	extern ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
onStationDialogDefn	extern DialogDefn	Development:SIMNET:libmac: dialog.h
bingoFuelDialogDefn	extern DialogDefn	Development:SIMNET:libmac: dialog.h
undoField	extern PushButtonFieldDefn	Development:SIMNET:libmac: dialog.h
cancelField	extern PushButtonFieldDefn	Development:SIMNET:libmac: dialog.h

Table 2.18-1 CASMac.h Variable Information.

2.18.1.3 version.h

Development:SIMNET:MCC:CAS:version.h

version.h defines constants that determine which version of the CAS application is compiled.

2.18.1.4 data.c

Development:SIMNET:MCC:CAS:data.c

data.c defines various data structures used by the CAS application such as tables of information about CAS missions. Table 2.18-2 describes the variables used by data.c.

Variables		
Variable	Type	Where Typedef Declared
application	pointer to char	Standard C type.
authors	pointer to char	Standard C type.
copyright	pointer to char	Standard C type.
undoField	extern PushButtonFieldDefn	Development:SIMNET:libmac: dialog.h
cancelField	extern PushButtonFieldDefn	Development:SIMNET:libmac: dialog.h
descriptionStrings	pointer to char	Standard C type.

Table 2.18-2 data.c Variable Information.

2.18.1.5 resource.h

Development:SIMNET:MCC:CAS:resource.h

resource.h defines the numbers of the resources present in the CAS Pictures resource file.

2.18.1.6 ditl.h

Development:SIMNET:MCC:CAS:ditl.h

ditl.h defines the numbers of items within CAS application dialogs.

2.18.2 CAS Console Software

2.18.2.1 condition.c

Development:SIMNET:MCC:CAS:condition.c

condition.c implements dialogs reporting the situations of aircraft arriving on station and aircraft reaching the bingo fuel condition. Table 2.18-3 describes the variables used by condition.c.

Variables		
Variable	Туре	Where Typedef Declared
conditionDialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
currentCondition	MissionHandle	Development:SIMNET:MCC: CAS:CASMac.h
conditionTime	unsigned long	Standard C type.
conditionBuffe:	MissionDescriptor	Development:SIMNET:MCC: CAS:CASMac.h
conditionCallSignField	TextFieldDefn	Development:SIMNET:libmac: dialog.h
conditionLocationField	CoordinatesFieldDefn	Development:SIMNET:libmac: dialog.h
conditionHeadingField	NumberFieldDefn	Development:SIMNET:libmac: dialog.h
conditionFieldList	pointer to array of FieldDefn	Development:SIMNET:libmac: dialog.h
bingoFuelDialogDefn	DialogDefn	Development:SIMNET:libmac: dialog.h
onStationDialogDefn	DialogDefn	Development:SIMNET:libmac: dialog.h

Table 2.18-3 condition.c Variable Information.

2.18.2.1.1 SetUpCondition

SetUpCondition initializes the condition dialogs. The function call is SetUpCondition(). Table 2.18-4 describes the functions called using this function.

Calls		
Function	Where Described	
NewPtr	Standard Memory Manager function for Macintosh.	
	Called By	
Function	Where Described	
SetUp	See 2.18.2.8.1.	

Table 2.18-4 SetUpCondition Information.

2.18.2.1.2 CheckForCondition

CheckForCondition checks for an aircraft arriving on station or reaching its bingo fuel condition. The function call is CheckForCondition(). Table 2.18-5 describes the internal variables used and functions called using this function.

Variable	Type	Where Typedef Declared
now	unsigned long	Standard C type.
time	unsigned long	Standard C type.
m	register MissionHandle	Development:SIMNET:MCC: CAS:CASMac.h

Calls		
Function	Where Described	
GetDateTime	Standard Operating System Utility function for Macintosh.	
UpdateMission	See Section 2.18.2.6.2.	
CancelMission	See Section 2.18.2.6.4.	
ThrowDialog	See Section 2.22.1.11.3.	
ClearDialogsForMission	See Section 2.18.2.2.3.	
RaiseCondition	See Section 2.18.2.1.3.	
	6. W. J. D.	
	Called By	
Function	Where Described	
MainEventLoop	See Section 2.18.2.5.2.	

Table 2.18-5 CheckForCondition Information.

2.18.2.1.3 RaiseCondition

RaiseCondition interrupts the user with a notice of an aircraft on station or a bingo fuel condition. The function call is RaiseCondition(m, dialog). Table 2.18-6 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
m	MissionHandle	Development:SIMNET:MCC: CAS:CASMac.h
dialog	pointer to DialogDefn	Development:SIMNET:libmac: dialog.h
	Calls	
Function	Where Described	
ClearDialogsForMission	See Section 2.18.2.2.3.	
ShowDialog	See Section 2.22.1.11.1.	
ShowWindow	Standard Window Manager function for Macintosh.	
SysBeep	Standard Operating System Utility function for Macintosh.	
GetDateTime	Standard Operating System Utility function for Macintosh.	
	Called By	
Function	Where Described	
CheckForCondition	See Section 2.18.2.1.2.	
MainEventLoop	See Section 2.18.2.5.2.	

Table 2.18-6 RaiseCondition Information.

2.18.2.1.4 ConditionFetch

ConditionFetch reads the current values of the station and bingo fuel condition data structures into the Condition dialogs. The function call is ConditionFetch(dialog). Table 2.18-7 describes the parameters used and functions called using this function.

	Parameters	-	
Parameter	Type	Where Typedef Declared	
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h	
	Internal Variables	-	
Variable	Туре	Where Typedef Declared	
theltem	Handle	Development:THINK C: Mac #includes:MacTypes.h	
i	int	Standard C type.	
box	Rect	Development:THINK C: Mac #includes:MacTypes.h	
	Calls		
Function	Where Described	Where Described	
GetDItem	Standard Dialog Manager f	Standard Dialog Manager function for Macintosh.	
HideControl	Standard Control Manager	Standard Control Manager function for Macintosh.	
StuffHeldMission	See Section 2.18.2.2.9.	See Section 2.18.2.2.9.	

Table 2.18-7 ConditionFetch Information.

2.18.2.1.5 ConditionEvent

ConditionEvent handles events in the Condition dialog. The function call is ConditionEvent(dialog, itemNo). Table 2.18-8 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
itemNo	int	Standard C type.
	Colle	
	Calls	
Function	Where Described	
showhelp	See Section 2.22.1.19.4.	
UpdateDialog	See Section 2.22.1.11.2.	
CancelMission	See Section 2.18.2.6.4.	
ThrowDialog	See Section 2.22.1.11.3.	
CheckMandatoryFields	See Section 2.22.1.13.1.	
UpdateMission	See Section 2.18.2.6.2.	
ClearHot	See Section 2.18.2.6.5.	
HiliteMission	See Section 2.18.2.6.3.	

Table 2.18-8 ConditionEvent Information.

2.18.2.2 dialog.c

Development:SIMNET:MCC:CAS:dialog.c

dialog.c implements dialogs for creating and viewing the status of CAS missions. Table 2.18-9 describes the variables used by dialog.c.

Variables		
Variable	Туре	Where Typedef Declared
preplannedDialogDefn	extern DialogDefn	Development:SIMNET:libmac: dialog.h
onCallDialogDefn	extern DialogDefn	Development:SIMNET:libmac: dialog.h
heldDialgoDefn	extern DialogDefn	Development:SIMNET:libmac: dialog.h
pastDialogDefn	extern DialogDefn	Development:SIMNET:libmac: dialog.h
missionDialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
currentMission	MissionHandle	Development:SIMNET:MCC: CAS:CASMac.h
missionBuffer	MissionDescriptor	Development:SIMNET:MCC: CAS:CASMac.h
futureTOTField	DTGFieldDefn	Development:SIMNET:libmac: dialog.h
futureCallSignField	TextFieldDefn	Development:SIMNET:libmac: dialog.h
futureLocationField	CoordinatesFieldDefn	Development:SIMNET:libmac: dialog.h
futureHeadingField	NumberFieldDefn	Development:SIMNET:libmac: dialog.h
futureTargetFields	RBFieldDefn	Development:SIMNET:libmac: dialog.h
futureSortiesField	NumberFieldDefn	Development:SIMNET:libmac: dialog.h
futureFieldList	pointer to array of FieldDefn	Development:SIMNET:libmac: dialog.h
preplannedDialogDefn	DialogDefn	Development:SIMNET:libmac: dialog.h
onCallDialogDefn	DialogDefn	Development:SIMNET:libmac: dialog.h
heldCallSignField	TextFieldDefn	Development:SIMNET:libmac: dialog.h
heldLocationField	CoordinatesFieldDefn	Development:SIMNET:libmac dialog.h
heldHeadingField	NumberFieldDefr	Development:SIMNET:libmac: dialog h
heldFieldList	pointer to array of FieldDefn	Development:SIMNET:libmac: dialog.h
heldDialogDefn	DialogDefn	Development:SIMNET:libmac: dialog.h
past ResultsField	TextFieldDefn	Development:SIMNET:libmac: dialog.h
pastFieldList	pointer to array of FieldDefn	Development SIMNET:libmac: dialog.h
pastDialogDefn	DialogDefn	Development:SIMNET:libmac: dialog h

Table 2.18-9 dialog.c Variable Information.

2.18.2.2.1 SetUpDialog

SetUpDialog initializes the mission dialog data structures. The function call is SetUpDialog(). Table 2.18-10 describes the functions called using this function.

	Calls
Function	Where Described
NewPtr	Standard Memory Manager function for Macintosh.
	Called By
Function	Where Described
SetUp	See Section 2.18.2.8.1.

Table 2.18-10 SetUpDialog Information.

2.18.2.2.2 ShowMission

ShowMission puts up a dialog box, box, for a mission, m, according to the status of the mission. The function call is ShowMission(m, box). Table 2.18-11 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
m	MissionHandle	Development:SIMNET:MCC: CAS:CASMac.h
box	pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
dialog	pointer to DialogDefn	Development:SIMNET:libmac: dialog.h
	Calls	
Function	Where Described	
ShowDialog	See Section 2.22.1.11.1.	
ZoomToWindow	See Section 2.22.1.47.4.	
Show\vindow	Standard Window Manage	r function for Macintosh.
	Called By	
Function	Where Described	
ScheduleSelect	See Section 2.18.2.7.3.	
ScheduleEvent	See Section 2.18.2.7.12.	

Table 2.18-11 ShowMission Information.

2.18.2.2.3 ClearDialogsForMission

ClearDialogsForMission throws away the frontmost dialogs for help, and alerts any dialogs related to the indicated mission, m. The function call is ClearDialogsForMission(m). Table 2.18-12 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
m	MissionHandle	Development:SIMNET:MCC: CAS:CASMac.h
	Internal Variable	000
Variable	Type	Where Typedef Declared
W	WindowPtr	Development:THINK C: Mac #includes:WindowMgr.h
newFront	WindowPtr	Development:THINK C: Mac #includes:WindowMgr.h
	Calls	
Function	Where Described	
ThrowDialog	See Section 2.22.1.11.3.	
FrontWindow	Standard Window Manager function for Macintosh.	
DisposDialog	Standard Dialog Manager function for Macintosh.	
	Called By	
Function	Where Described	
RaiseCondition	See Section 2.18.2.1.3	3.
CheckForCondition	See Section 2.18.2.1.2	2.

Table 2.18-12 ClearDialogsForMission Information.

2.18.2.2.4 StuffTimeOnTarget

StuffTimeOnTarget fills time on target data into the specified dialog item. The function call is StuffTimeOnTarget (dialog, itemNo, m). Table 2.18-13 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
itemNo	int	Standard C type.
m	MissionHandle	Development:SIMNET.MCC: CAS:CASMac.h
	Internal Variables	
Variable	Туре	Where Typedel Declared
str	array of 20 char	Standard C type.
	Calls	
Function	Where Described	
OTOT O	See Section 2.22.1.15 1.	
DTGToString	See Section 2.22.1.13 1.	

Called By		
Function	Where Described	
OnCallFetch	See Section 2.18.2.2.6.	
StuffHeldMission	See Section 2.18.2.2.9.	
PastFetch	See Section 2.18.2.2.12.	

Table 2.18-13 StuffTimeOnTarget Information.

2.18.2.2.5 ZoomMissionDown

ZoomMissionDown zooms between an entry in the Scheduled Missions Table and its popup Mission dialog. The function call is ZoomMissionDown (). Table 2.18-14 describes the internal variables used and functions called using this function.

	Internal Variab	les
Variable	Туре	Where Typedef Declared
row	int	Standard C type.
box	Rect	Development:THINK C:
		Mac #includes:MacTypes.h
	Calls	
Function	Where Described	
ScrollTableEntryToRow	See Section 2.22.1.34	1.1.
ScrollTableRowRect	See Section 2.22.1.34	1.3.
HideWindow	Standard Window Man	ager function for Macintosh.
ZoomToWindow	See Section 2.22.1.47	7.4.
	Called By	:
Function	Where Described	
FutureEvent	See Section 2.18.2.2.	7.

Table 2.18-14 ZoomMissionDown Information.

2.18.2.2.6 OnCallFetch

OnCallFetch reads current mission data into the On Call Mission dialog. The function call is OnCallFetch(dialog). Table 2.18-15 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
	Calls	
Function	Where Described	-
StuffTimeOnTarget	See Section 2.18.2.2.4.	

Table 2.18-15 OnCallFetch Information.

2.18.2.2.7 FutureEvent

FutureEvent handles events in the Preplanned Missions dialog. The function call is FutureEvent(dialog, itemNo). Table 2.18-16 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
itemNo	int	Standard C type.
	Calls	
Function	Where Described	
showhelp	See Section 2.22.1.19.4.	
UpdateDialog	See Section 2.22.1.11.2.	
CancelMission	See Section 2.18.2.6.4.	
ThrowDialog	See Section 2.22.1.11.3.	
CheckMandatoryFields	See Section 2.22.1.13.1.	
CheckSortieLimits	See Section 2.18.2.3.4.	
UpdateMission	See Section 2.18.2.6.2.	
HiliteMission	See Section 2.18.2.6.3.	
ZoomMissionDown	See Section 2.18.2.2.5.	

Table 2.18-16 FutureEvent Information.

2.18.2.2.8 ValidTOT

ValidTOT determines if the time on target is valid. The time on target must be at least 25 minutes from now and on the same day, or it is not valid. The function call is ValidTOT(dialog, fp, str). Table 2.18-17 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
fp	pointer to TypeInFieldDefn	Development:SIMNET:libmac: dialog.h
str	pointer to char	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
now	unsigned long	Standard C type.
today	DateTimeRec	Development:THINK C Mac #includes:OSUtil h
	Return Values	
Return Value	Туре	Meaning
0	int	Time not valid.
	int	Time valid.

Calls		
Function Where Described		
GetDateTime	Standard Operating System Utility function for Macintosh.	
ShowCaution	See Section 2.22.1.4.1.	
GetTime	Standard Operating System Utility function for Macintosh.	
SameDay	Macro defined in Development:SIMNET:MCC:CAS:CASMac.h.	

Table 2.18-17 ValidTOT Information.

2.18.2.2.9 StuffHeldMission

StuffHeldMission fills in the fields of a dialog, dialog, for a mission, m, with a "held" status. The function call is StuffHeldMission(dialog, m). Table 2.18-18 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
m	MissionHandle	Development:SIMNET:MCC: CAS:CASMac.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
descriptionStrings	extern pointer to array of char	Standard C type.
str	array of 10 char	Standard C type.
	Calls	
Function	Where Described	
SetText	See Section 2.22.1.11.8.	
StuffTimeOnTarget	See Section 2.18.2.2.4.	
	Called By	
Function	Where Described	
HeldFetch	See Section 2.18.2.2.10.	
ConditionFetch	See Section 2.18.2.1.4.	

Table 2.18-18 StuffHeldMission Information.

2.18.2.2.10 HeldFetch

HeldFetch reads the current values of the "held" missions into the Held Missions dialog. The function call is HeldFetch(dialog). Table 2.18-19 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h

Calls		
Function	Where Described	
StutfHeldMission	See Section 2.18.2.2.9.	

Table 2.18-19 HeldFetch Information.

2.18.2.2.11 HeldEvent

HeldEvent handles events in the Held Missions dialog. The function call is HeldEvent(dialog, itemNo). Table 2.18-20 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
itemNo	int	Standard C type.
	Calls	
Function	Where Described	<u></u>
showhelp	See Section 2.22.1.19.4.	
UpdateDialog	See Section 2.22.1.11.2.	
CancelMission	See Section 2.18.2.6.4.	
ThrowDialog	See Section 2.22.1.11.3.	
CheckMandatoryFields	See Section 2.22.1.13.1.	
UpdateMission	See Section 2.18.2.6.2.	
ClearHot	See Section 2.18.2.6.5.	

Table 2.18-20 HeldEvent Information.

2.18.2.2.12 PastFetch

PastFetch reads the values of past missions into the Past Missions dialog. The function call is PastFetch(dialog). Table 2.18-21 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
	Internal Variables	
Variable	Type	Where Typedef Declared
descriptionStrings	extern pointer to array of char	Standard C type.
str	array of 10 char	Standard C type
	Calls	
Function	Where Described	
SetText	See Section 2.22.1.11.8.	
StuffTimeOnTarget	See Section 2.18.2.2.4.	

Table 2.18-21 PastFetch Information.

2.18.2.2.13 PastEvent

PastEvent handles events in the Past Missions dialog. The function call is PastEvent(dialog, itemNo). Table 2.18-22 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
itemNo	int	Standard C type.
Function	Where Described	
	Calls	
showhelp	See Section 2.22.1.19.4.	
UpdateDialog	See Section 2.22.1.11.2.	
UpdateMission	See Section 2.18.2.6.2.	
ThrowDialog	See Section 2.22.1.11.3.	

Table 2.18-22 PastEvent Information.

2.18.2.3 limits.c

Development:SIMNET:MCC:CAS:limits.c

limits.c contains routines that implement and display the limits of preplanned and on-call CAS sorties. Table 2.18-23 describes the variables used by limits.c.

Variables		
Variable	Туре	Where Typedef Declared
totalSorties	int	Standard C type.
preplannedSorties	int	Standard C type.
daySortiesAllotted	DateTimeRec	Development:THINK C: Mac #includes:OSUtil.h
monthNames	pointer to array of char	Standard C type.

Table 2.18-23 limits.c Variable Information.

2.18.2.3.1 SetSortieLimits

SetSortieLimits sets the total and per-day sortie limits. *totall* is the total number of sorties and *preplanned* is the number of sorties for today. The function call is SetSortieLimits(total, preplanned). Table 2.18-24 describes the parameters used and functions called using this function.

	Paramet	ers
Parameter	Туре	Where Typedef Declared
total	int	Standard C type.
preplanned	int	Standard C type.
	Calls	
Function	Where Describe	d
GetTime	Standard Operating	System Utility function for Macintosh.

	Called By	
Function	Where Described	
LoadCannedLimits	See Section 2.18.2.4.2.	
ProcessRequest	See Section 2.18.2.5.3.	

Table 2.18-24 SetSortieLimits Information.

2.18.2.3.2 AdditionalSorties

Additional Sorties is called when more sorties are added to the number allotted for today. *extra* is the number of additional sorties requested. These sorties may only be used for oncall missions. The function call is Additional Sorties (extra). Table 2.18-25 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
extra	int	Standard C type.
	Called By	
Function	Where Described	
MainEventLoop	See Section 2.18.2.5.2.	

Table 2.18-25 Additional Sorties Information.

2.18.2.3.3 ShowSummary

ShowSummary puts up a dialog box summarizing the sortie limits and number of sorties used so far. The function call is ShowSummary(). Table 2.18-26 describes the internal variables used and functions called using this function.

Internal Variables		
Variable	Туре	Where Typedef Declared
dialog	register DialogPtr	Development:THINK C: Mac #includes:DialogMgr.h
i	int	Standard C type.
totalSortiesUsed	int	Standard C type.
preplannedSortiesUsed	int	Standard C type.
totalSortiesRemaining	lint	Standard C type.
theltem	Handle	Development:THINK C: Mac #includes:MacTypes.h
box	Rect	Development:THINK C: Mac #includes:MacTypes.h
str	array of 256 char	Standard C type.

Calls		
Function	Where Described	
ShowSimpleDialog	See Section 2.22.1.40.1.	
SetWTitle	Standard Window Manager function for Macintosh.	
GetDitem	Standard Dialog Manager function for Macintosh.	
SetIText	Standard Dialog Manager function for Macintosh.	
SortiesScheduled	See Section 2.18.2.3.5.	
NumToString	Standard Binary to Decimal Conversion Package function for Macintosh.	
ShowWindow	Standard Window Manager function for Macintosh.	
	Called By	
Function	Where Described	
ScheduleEvent	See Section 2.18.2.7.12.	

Table 2.18-26 ShowSummary Information.

2.18.2.3.4 CheckSortieLimits

CheckSortieLimits checks to see that the sortie limits are not exceeded. The function call is CheckSortieLimits(currentMission, b). Table 2.18-27 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
currentMission	MissionHandle	Development:SIMNET:MCC: CAS:CASMac.h
b	register pointer to MissionDescriptor	Development:SIMNET:MCC: CAS:CASMac.h
<u>,</u>	Internal Variables	
Variable	Туре	Where Typedef Declared
m	register MissionHandle	Development:SIMNET:MCC: CAS:CASMac.h
totalSortiesUsed	int	Standard C type.
preplannedSortiesUsed	int	Standard C type.
str	array of char	Standard C type.
	Return Values	
Return Value	Type	Meaning
0	int	Sortie limit will be exceeded.
1	int	Sortie limit will not be exceeded.
	Calla	····
Function	Calls Described	
	Where Described	
SameDay ShowCaution	Macro defined in Development:SIMNET:MCC:CAS:CASMac.h.	
SortiesScheduled	See Section 2.22.1.4.1.	
SortiesScheduled	See Section 2.18.2.3.5.	

	Called By
Function	Where Described
FutureEvent	See Section 2.18.2.2.7.

Table 2.18-27 CheckSortieLimits Information.

2.18.2.3.5 SortiesScheduled

SortiesScheduled computes the number of sorties scheduled for a given day, *date*. The function call is SortiesScheduled(date, totalSortiesUsed, preplannedsortiesUsed). Table 2.18-28 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
date	register pointer to DateTimeRec	Development:THINK C: Mac #includes:OSUtil.h
totalSortiesUsed	pointer to int	Standard C type.
preplannedSortiesUsed	pointer to int	Standard C type.
		222
	internal Variables	
Variable	Type	Where Typedef Declared
m	register MissionHandle	Development:SIMNET:MCC: CAS:CASMac.h
	Calls	
Function	Where Described	
SameDay	Macro defined in Developm	ent:SIMNET:MCC:CAS:CASMac.h.
	Called By	
Function	Where Described	
CheckSortieLimits	See Section 2.18.2.3.4.	
ShowSummary	See Section 2.18.2.3.3.	

Table 2.18-28 SortiesScheduled Information.

2.18.2.4 load.c

Development:SIMNET:MCC:CAS:load.c

load.c loads canned data into application data structures, in the standalone demo version of the CAS application. The routines in this file are only compiled if VERSION is FULDAGAP. Table 2.18-29 describes the variables used by load.c.

Internal Variables		
Variable Type Where Typedef Declared		
cannedMissions	array of CannedMission	Development:SIMNET:MCC: CAS:load.c

Table 2.18-29 load.c Variable Information.

2.18.2.4.1 LoadCannedTerrainMap

LoadCannedTerrainMap loads a canned terrain map. The function call is LoadCannedTerrainMap(). Table 2.18-30 describes the function calling this function.

Called By		
Function	Where Described	
main	See Section 2.18.2.5.1.	

Table 2.18-30 LoadCannedTerrainMap Information.

2.18.2.4.2 LoadCannedLimits

LoadCannedLimits loads canned sortie limits. The function call is LoadCannedLimits(). Table 2.18-31 describes the functions called using this function.

Calls		
Function	Where Described	
SetSortieLimits	See Section 2.18.2.3.1.	
	Called By	
Function	Where Described	
main	See Section 2.18.2.5.1.	

Table 2.18-31 LoadCannedLimits Information.

2.18.2.4.3 LoadCannedSchedule

LoadCannedSchedule populates the mission schedule with canned data. The function call is LoadCannedSchedule(). Table 2.18-32 describes the internal variables used and functions called using this function.

Internal Variables		
Variable	Type	Where Typedef Declared
sortiesRemaining	extern array of int	Standard C type.
m	MissionHandle	Development:SIMNET:MCC: CAS:CASMac.h
cm	pointer to CannedMission	Development:SIMNET:MCC: CAS:load.c
now	unsigned long	Standard C type.
Function	Calls	
	Where Described	
GetDateTime	Standard Operating system Utility function for Macintosh.	
NewMission	See Section 2.18.2.6.1.	
HLock	Standard Memory Manager function for Macintosh.	
StringToMapCoordinates	See Section 2.22.1.26.1.	
DTGElapsed	See Section 2.22.1.15.1.	
HUnlock	Standard Memory Manager function for Macintosh.	
UpdateMission	See Section 2.18.2.6.2.	

	Called By	
Function	Where Described	
main	See Section 2.18.2.5.1.	

Table 2.18-32 LoadCannedSchedule Information.

2.18.2.5 main.c

Development:SIMNET:MCC:CAS:main.c

main.c contains the CAS application's program entry point and main event loop.

2.18.2.5.1 main

main is the program entry point. The function call is main(). Table 2.18-33 describes the functions called using this function.

Calls		
Function	Where Described	
SetUp	See Section 2.18.2.8.1.	
ProcessRequest	See Section 2.18.2.5.3.	
SetUpAppleTalk	See Section 2.22.1.3.1.	
DownloadTerrainMap	See Section 2.22.1.3.4.	
MenuBarTitle	See Section 2.22.1.43.1.	
InstallClock	See Section 2.22.1.6.4.	
ShowSchedule	See Section 2.18.2.7.2.	
LooadCannedTerrainMap	See Section 2.18.2.4.1.	
LoadCannedLimits	See Section 2.18.2.4.2.	
LoadCannedSchedule	See Section 2.18.2.4.3.	
MainEventLoop	See Section 2.18.2.5.2.	

Table 2.18-33 main Information.

2.18.2.5.2 MainEventLoop

MainEventLoop constantly fields incoming events. The function call is MainEventLoop(). Table 2.18-34 describes the parameters used and functions called using this function.

	Internal Variab	ies
Variable	Туре	Where Typedef Declared
myEvent	EventRecord	Development:THINK C: Mac #includes:EventMgr.h

Calls		
Function	Where Described	
CheckForCondition	See Section 2.18.2.1.2.	
UpdateClock	See Section 2.22.1.6.2.	
SystemTask	Standard Desk Manager function for Macintosh.	
GetNextEvent	Standard Toolbox Event Manager function for Macintosh.	
AdditionalSorties	See Section 2.18.2.3.2.	
RaiseCondition	See Section 2.18.2.1.3.	
ATPCloseSocket	Standard Appletalk Manager function for Macintosh.	
ExitToShell	Standard Segment Loader function for Macintosh.	
ShowVersions	See Section 2.22.1.44.1.	
WindowEvent	See Section 2.22.1.46.2.	
NetworkEventHandler	See Section 2.22.1.3.5.	
	Called By	
Function	Where Described	
main	See Section 2.18.2.5.1.	

Table 2.18-34 MainEventLoop Information.

2.18.2.5.3 ProcessRequest

ProcessRequest processes a request received from the MCC host. This function is only compiled if VERSION is APPLETALK. The function call is ProcessRequest(hdl). Table 2.18-35 describes the parameters used and functions called using this function.

Parameters			
Parameter	Type	Where Typedef Declared	
hdl	register Handle	Development:THINK C:	
		Mac #includes:MacTypes.h	
	Internal Variable	es	
Variable	Туре	Where Typedef Declared	
р	register Ptr	Development:THINK C:	
		Mac #includes:MacTypes.h	
errCode	int	Standard C type.	
	Calls		
Function	Where Described		
SetDateTime	Standard Operating Sys	stem Utility function for Macintosh.	
SetSortieLimits	See Section 2.18.2.3.1	•	
ATPResponse	Standard Appletalk Man	nager function for Macintosh.	
Restart	Standard Operating System Utility function for Macintosh.		
ATPError	See Section 2.22.1.3.6		
	Called By		
Function	Where Described		
main	See Section 2.18.2.5.1		

Table 2.18-35 ProcessRequest Information.

2.18.2.6 mission.c

Development:SIMNET:MCC:CAS:mission.c

mission.c contains routines for creating and updating data structures describing CAS missions.

2.18.2.6.1 NewMission

NewMission allocates a record for a new mission. The function call is NewMission(type). Table 2.18-36 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
type	int	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
m	register MissionHandle	Development:SIMNET:MCC: CAS:CASMac.h
now	unsigned long	Standard C type.
	Return Values	
Return Value	Type	Meaning
m	MissionHandle	Record for new mission.
	Calls	
Function	Where Described	
NewHandle	Standard Memory Manager function for Macintosh.	
GetDateTime	Standard Operating System Utility function for Macintosh.	
DTGElapsed	See Section 2.22.1.15.3.	
	Called By	
Function	Where Described	
LoadCannedSchedule	See Section 2.18.2.4.3.	
ScheduleEvent	See Section 2.18.2.7.12.	

Table 2.18-36 NewMission Information.

2.18.2.6.2 UpdateMission

UpdateMission updates a mission, m, in the schedule. The function call is UpdateMission(m). Table 2.18-37 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
m	MissionHandle	Development:SIMNET:MCC: CAS:CASMac.h
	Calls	
Function	Where Described	
InstallScrollTableEntry	See Section 2.22.1.21.1.	

Called By		
Function Where Described		
CheckForCondition	See Section 2.18.2.1.2.	
ConditionEvent	See Section 2.18.2.1.5.	
FutureEvent	See Section 2.18.2.2.7.	
HeldEvent	See Section 2.18.2.2.11.	
PastEvent	See Section 2.18.2.2.13.	
LoadCannedSchedule	See Section 2.18.2.4.3.	
ClearHot	See Section 2.18.2.6.5.	

Table 2.18-37 UpdateMission Information.

2.18.2.6.3 HiliteMission

HiliteMission hilites a mission, m, in the schedule table. The function call is HiliteMission(m). Table 2.18-38 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
m	MissionHandle	Development:SIMNET:MCC: CAS:CASMac.h
	Calla	
	Calls	
Function	Where Described	
SetScrollTableSelection	See Section 2.22.1.37.2.	
	Called By	
Function	Where Described	
ConditionEvent	See Section 2.18.2.1.5.	
FutureEvent	See Section 2.18.2.2.7.	

Table 2.18-38 HiliteMission Information.

2.18.2.6.4 CancelMission

CancelMission removes a mission, m, from the schedule and discards it. The function call is CancelMission(m). Table 2.18-39 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
m	MissionHandle	Development:SIMNET:MCC: CAS:CASMac.h
	Calls	
Function	Where Described	

Called By		
Function	Where Described	
CheckForCondition	See Section 2.18.2.1.2.	
ConditionEvent	See Section 2.18.2.1.5.	
FutureEvent	See Section 2.18.2.2.7.	
HeldEvent	See Section 2.18.2.2.11.	

Table 2.18-39 CancelMission Information.

2.18.2.6.5 ClearHot

ClearHot is called when a mission, m, is cleared hot. The function call is ClearHot(m). Table 2.18-40 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
m	MissionHandle	Development:SIMNET:MCC: CAS:CASMac.h
· · · · · · · · · · · · · · · · · · ·	Internal Variable	
Variable	Туре	Where Typedef Declared
now	unsigned long	Standard C type.
	0.11.	
	Calls	
Function	Where Described	
GetDateTime	Standard Operating System Utility function for Macintosh.	
DTGElapsed	See Section 2.22.1.15.3.	
UpdateMission	See Section 2.18.2.6.2.	
NewPtr	Standard Memory Manager function for Macintosh	
NewHandle	Standard Memory Manager function for Macintosh.	
SetUpATPRequest	See Section 2.22.1.3.2.	
ATPError	See Section 2.22.1.3.6.	
ATPRequust	Standard Appletalk Mana	ager function for Macintosh.
	Called By	
Function	Where Described	
ConditionEvent	See Section 2.18.2.1.5.	
HeldEvent	See Section 2.18.2.2.11	1.

Table 2.18-40 ClearHot Information.

2.18.2.7 schedule.c

Development:SIMNET:MCC:CAS:schedule.c

schedule.c implements a dialog displaying a schedule of CAS missions. Table 2.18-41 describes the variables used by schedule.c.

Variables		
Variable	Туре	Where Typedef Declared
scheduleColumns	extern array of ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h
scheduleDialogDefn	extern DialogDefn	Development:SIMNET:libmac: dialog.h
scheduleDialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
scheduleColumns	array of ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h
scheduleField	ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
scheduleFieldList	pointer to FieldDefn	Development:SIMNET:libmac: dialog.h
scheduleDialogDefn	DialogDefn	Development:SIMNET:libmac: dialog.h

Table 2.18-41 schedule.c Variable Information.

2.18.2.7.1 SetUpSchedule

SetUpSchedule initializes the mission schedule. The function call is SetUpSchedule(). Table 2.18-42 describes the internal variables used and functions called using this function.

	Internal Varia	bles
Variable	Type	Where Typedef Declared
port	GrafPort	Development:TH/NK C: Mac #includes.Quickdraw.h
	Calls	
Function	Where Described	
NewPtr	Standard Memory Ma	nager function for Macintosh.
OpenPort	Standard Quickdraw function for Macintosh.	
TextFont	Standard Quickdraw function for Macintosh.	
TextSize	Standard Quickdraw function for Macintosh.	
StringWidth	Standard Quickdraw function for Macintosh.	
CharWidth	Standard Quickdraw	function for Macintosh.
ClosePort	Standard Quickdraw function for Macintosh.	
	Called By	
Function	Where Described	
SetUp	See Section 2.18.2.8	B.1.

Table 2.18-42 SetUpSchedule Information.

2.18.2.7.2 ShowSchedule

ShowSchedule brings up the MissionSchedule dialog. The function call is ShowSchedule(). Table 2.18-43 describes the functions called using this function.

	Calls
Function	Where Described
ShowDialog	See Section 2.22.1.11.1.
ShowWindow	Standard Window Manager function for Macintosh.
	Called By
Function	Where Described
main	See Section 2.18.2.5.1.

Table 2.18-43 ShowSchedule Information.

2.18.2.7.3 ScheduleSelect

ScheduleSelect checks the validity of the seleted item and brings up the next dialog describing the selection. The function call is ScheduleSelect(defn, row, box, event). Table 2.18-44 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
row	int	Standard C type.
box	pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h
event	pointer to EventRecord	Development:THINK C: Mac #includes:EventMgr.h
	Internal Variables	
Variable	Type	Where Typedef Declared
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
	Calls	
Function	Where Described	
ScrollTableRowToEntry	See Section 2.22.1.34.1.	
SetScrollTableSelection	See Section 2.22.1.37.2.	
ShowMission	See Section 2.18.2.2.2.	

Table 2.18-44 ScheduleSelect Information.

2.18.2.7.4 ScheduleHilite

ScheduleHilite highlights an entry in the Schedule Table. The function call is ScheduleHilite(defn, entry, box). Table 2.18-45 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
box	pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h
	Calls	
Function	Where Described	
InvertRect	Standard Quickdraw function for Macintosh.	

Table 2.18-45 ScheduleHilite Information.

2.18.2.7.5 ScheduleDrawType

ScheduleDrawType fills in the Type field of the specified column in the Schedule Table. The function call is ScheduleDrawType(defn, col, entry). Table 2.18-46 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
defn	poindter to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
col	pointer to ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h
entry	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll h
	Calls	
Function	Where Described	
Move	Standard Quickdraw function for Macintosh.	
CharWidth	Standard Quickdraw function	n for Macintosh.
DrawString	Standard Quickdraw function for Macintosh.	

Table 2.18-46 ScheduleDrawType Information.

2.18.2.7.6 ScheduleDrawTOT

ScheduleDrawTOT fills in the TOT field of the specified column in the Schedule Table. The function call is ScheduleDrawTOT(defn, col, entry). Table 2.18-47 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	poindter to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
col	pointer to ScroltTableColumnDefn	Development:SIMNET:libmac: scroll.h
entry	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h

	Internal Variable	es
Variable	Type	Where Typedef Declared
str	array of 20 char	Standard C type.
	Calls	
Function	Where Described	
DTGToString	See Section 2.22.1.15	.1
DrawText	Standard Quickdraw function for Macintosh.	

Table 2.18-47 ScheduleDrawTOT Information.

2.18.2.7.7 ScheduleDrawLocation

ScheduleDrawLocation fills in the Location field of the specified column in the Schedule Table. The function call is ScheduleDrawLocation(defn, col, entry). Table 2.18-48 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
defn	poindter to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
col	pointer to ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h
entry	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
	Calls	
Function	Where Described	
DrawText	Standard Quickdraw function for Macintosh.	

Table 2.18-48 ScheduleDrawLocation Information.

2.18.2.7.8 ScheduleDrawDescription

ScheduleDrawDescription fills in the Description field of the specified column in the Schedule Table. The function call is ScheduleDrawDescription(defn, col, entry). Table 2.18-49 describes the parameters used and functions called using this function.

Parameters	
Туре	Where Typedef Declared
pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
pointer to ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h
register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
Internal Variables	
Туре	Where Typedef Declared
extern pointer to array of char	Standard C type
register pointer to char	Standard C type.
	Type pointer to ScrollTableFieldDefn pointer to ScrollTableColumnDefn register ScrollTableEntryHandle Internal Variables Type extern pointer to array of char

Calls		
Function	Where Described	
DrawText	Standard Quickdraw function for Macintosh.	

Table 2.18-49 ScheduleDrawDescription Information.

2.18.2.7.9 ScheduleDrawSorties

ScheduleDrawSorties fills in the Sorties field of the specified column in the Schedule Table. The function call is ScheduleDrawSorties(defn, col, entry). Table 2.18-50 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	poindter to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
col	pointer to ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h
entry	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
	Internal Variables	
Variable	Type	Where Typedef Declared
str	array of 10 char	Standard C type.
	Calls	
Function	Where Described	
NumToString	Standard Binary to Decimal Conversion Package function for Macintosh.	
Move	Standard Quickdraw function for Macintosh.	
CharWidth	Standard Quickdraw function for Macintosh.	
StringWidth	Standard Quickdraw function for Macintosh.	
DrawString	Standard Quickdraw function for Macintosh.	

Table 2.18-50 ScheduleDrawSorties Information.

2.18.2.7.10 ScheduleDrawResults

ScheduleDrawResults fills in the Results field of the specified column in the Schedule Table. The function call is ScheduleDrawResults(defn, col, entry). Table 2.18-51 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	poindter to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
col	pointer to ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h
entry	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h

·	Calls
Function	Where Described
DrawText	Standard Quickdraw function for Macintosh.

Table 2.18-51 ScheduleDrawResults Information.

2.18.2.7.11 ScheduleDrawStatus

ScheduleDrawStatus fills in the Status field of the specified column in the Schedule Table. The function call is ScheduleDrawStatus(defn, col, entry). Table 2.18-52 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
defn	poindter to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
col	pointer to ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h
entry	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
	Calls	· ·
Function	Where Described	
DrawString	Standard Quickdraw function for Macintosh.	
TextFace	Standard Quickdraw function for Macintosh.	

Table 2.18-52 ScheduleDrawStatus Information.

2.18.2.7.12 ScheduleEvent

ScheduleEvent handles events for the Schedule dialog. The function call is ScheduleEvent(dialog, itemNo). Table 2.18-53 describes the parameters used and functions called using this function.

Parameters	
Туре	Where Typedef Declared
pointer to DialogState	Development:SIMNET:libmac: dialog.h
int	Standard C type.
Internal Variables	
Туре	Where Typedef Declared
MissionHandle	Development:SIMNET:MCC: CAS:CASMac.h
Handle	Development:THINK C: Mac #includes:MacTypes.h
int	Standard C type.
Rect	Development:THINK C: Mac #includes:MacTypes.h
	Type pointer to DialogState int Internal Variables Type MissionHandle Handle int

Calls		
Function	Where Described	
showhelp	See Section 2.22.1.19.4.	
ShowSummary	See Section 2.18.2.3.3.	
NewMission	See Section 2.18.2.6.1.	
GetDltem	Standard Dialog Manager function for Macintosh.	
ShowMission	See Section 2.18.2.2.2.	

Table 2.18-53 ScheduleEvent Information.

2.18.2.8 setup.c

Development:SIMNET:MCC:CAS:setup.c

setup.c initializes the CAS application at start-up.

2.18.2.8.1 SetUp

SetUp initializes the SIMNET Close Air Support application. The toolbox is intialized, the SIMNET Resources and CAS Pictures files are opened, the Help Manager is intialized, and the dialogs are initialized. The function call is SetUp(). Table 2.18-54 describes the internal variables used and functions called using this function.

Internal Variables			
Variable	Type	Where Typedef Declared	
errCode	int	Standard C type.	
finalTicks	long	Standard C type.	
	Calls		
Function	Where Described		
InitToolbox	See Section 2.22.1.	20.1.	
Zoomlnit	See Section 2.22.1.	47.1.	
OpenResFile	Standard Resource	Manager function for Macintosh.	
MenuBarTitle	See Section 2.22.1.43.1.		
Delay	Standard Operating System Utility function for Macintosh.		
ExitToShell	Standard Segment Loader function for Macintosh.		
DeepShit	See Section 2.22.1.8.2.		
helpinit	See Section 2.22.1.19.1.		
SystemFailure	See Section 2.22.1.8.1.		
SetUpCondition	See Section 2.18.2.1.1.		
SetUpDialog	See Section 2.18.2.2.1.		
SetUpSchedule	See Section 2.18.2.7.1.		
	Called By		
Function	Where Described		
main	See Section 2.18.2.5.1.		

Table 2.18-54 SetUp Information.

2.18.3 Appearance of CAS Console User Interface

2.18.3.1 CAS Pictures Development:SIMNET:MCC:CAS:CAS Pictures

CAS Pictures contains resources that determine the appearance of the CAS application's user interface.

2.19 The CEW (Combat Engineering Workstation) Console

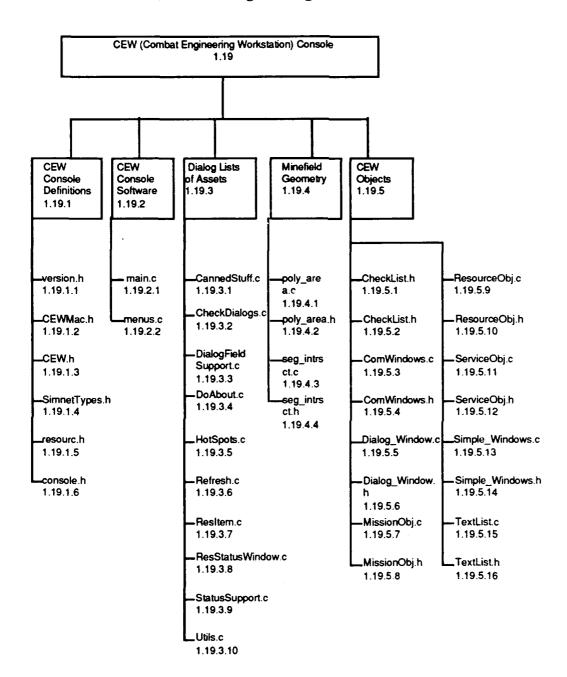

Figure 2.19-1: CEW (Combat Engineering Workstation)
Console Structure.

2.19.1 CEW Console Definitions

2.19.1.1 version.h

Development:SIMNET:MCC:CEW:version.h

version.h defines the version of the CEW Macintosh application to be compiled.

2.19.1.2 CEWMac.h

Development:SIMNET:MCC:CEW:CEWMac.h

CEWMac.h is the header file used by all of the CEW source code files in the CEW Macintosh application. Table 2.19-1 describes the variables used by CEWMac.h.

Variables		
Variable	Type	Where Typedef Declared
totalResources	extern short	Standard C type.
terrainMap	extern TerrainMap	Development:SIMNET:libmac: map.h
legalGEMSSDensities	extern array of float	Standard C type.
emplacementPointArray	extern array of short	Standard C type.
breach_availList	extern pointer to CheckList	Development:SIMNET:CEW: CheckList.h
move_availList	extern pointer to CheckList	Development:SIMNET:CEW: CheckList.h
emplace_availList	extern pointer to CheckList	Development:SIMNET:CEW: CheckList.h
stat_emplace_availList	extern pointer to CheckList	Development:SIMNET:CEW: CheckList.h
stat_breach_availList	extern pointer to CheckList	Development:SIMNET:CEW: CheckList.h
stat_move_availList	extern pointer to CheckList	Development:SIMNET:CEW: CheckList.h
cewResources	extern pointer to array of ResourceObj	Development:SIMNET:CEW: ResourceObj.h
review_dlog	extern pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h
emplace_dlog	extern pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h
main_window	extern pointer to ComWindow	Development:SIMNET:CEW: ComWindows.h
cewMission	extern pointer to array of MissionObj	Development:SIMNET:CEW MissionObj.h

Table 2.19-1 CEWMac,h Variable Information.

2.19.1.3 CEW.h

Development:SIMNET:MCC:CEW:CEW.h

CEW.h defines the MCC SIMNET Combat Engineering Workstation (CEW) parameters and interfaces.

2.19.1.4 SimnetTypes.h

Development:SIMNET:MCC:CEW:SimnetTypes.h

SimnetTypes.h contains a type definition of the UTMCoordinates array. Table 2.19-2 describes the variables used by SimnetTypes.h.

Variables			
Variable	Туре	Where Typedef Declared	
UTMCoordinates	unsigned array of 9 char	Standard C type.	

Table 2.19-2 SimnetTypes.h Variable Information.

2.19.1.5 resource.h

Development:SIMNET:MCC:CEW:resource.h

resource.h contains the Mac resource IDs for the CEW.

2.19.1.6 console.h

Development:SIMNET:MCC:CEW:console.h

console.h defines things relevant to communication between the Masscomp host and the Macintosh console. Table 2.19-3 describes the variables used by console.h.

Variables			
Variable	Туре	Where Typedef Declared	
hostSocket	extern long	Standard C type.	

Table 2.19-3 console.h Variable Information.

2.19.2 CEW Console Software

2.19.2.1 main.c

Development:SIMNET:MCC:CEW:main.c

main.c contains the CEW application's program entry point and main event loop. Table 2.19-4 describes the variables used by main.c.

Variables			
Variable	Туре	Where Typedef Declared	
main_window	pointer to ComWindow	Development:SIMNET:CEW: ComWindows.h	
emplace_dlog	pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h	
select_dlog	pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h	
breach_dlog	pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h	
move_dlog	pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h	
stat_emplace	pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h	
stat_breach	pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h	
stat_move	pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h	
review_dlog	pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h	
missionList	pointer to TextList	Development:SIMNET:CEW: TextList.h	
cewMission	pointer to array of NUM_OF_MISSION MissionObj	Development:SIMNET:CEW: MissionObj.h	
cewResources	pointer to array of NUM_OF_RESOURCES ResourceObj	Development:SIMNET:CEW: ResourceObj.h	
serviceq	pointer to ServiceObj	Development:SIMNET:CEW: ServiceObj.h	
nextMission	short	Standard C type.	
totalResources	short	Standard C type.	
authors	pointer to char	Standard C type.	
version	pointer to char	Standard C type.	
copyright	pointer to char	Standard C type.	
application	pointer to char	Standard C type.	
atpSocket	extern short	Standard C type.	

Table 2.19-4 main.c Variable Information.

2.19.2.1.1 main

main is the program entry point. The function call is main(). Table 2.19-5 describes the internal variables used and functions called using this function.

	Internal Variable	es
Variable	Туре	Where Typedef Declared
r	Rect	Development:THINK C: Mac #includes:MacTypes.h
r1	Rect	Development:THINK C: Mac #includes:MacTypes.h
i	short	Standard C type.
tempstr	array of 255 char	Standard C type
testmp	MapCoordinates	Development:SIMNET:libmac map.h

Calls		
Function	Where Described	
OpenResFile	Standard Resource Manager function for Macintosh.	
Notify	See Section 2.19.3.4.4.	
ExitToShell	Standard Segment Loader function for Macintosh.	
MacInits	See Section 2.19.2.1.3.	
ProcessRequest	See Section 2.19.2.1.5.	
SetUpAppleTalk	See Section 2.22.1.3.1.	
DownloadTerrainMap	See Section 2.22.1.3.4.	
LoadCannedTerrainMap	See Section 2.19.3.1.1.	
LoadCannedResources	See Section 2.19.3.1.2.	
ComWindow::initial	See Section 2.19.5.3.3.	
ComWindow::show	See Section 2.19.5.3.1.	
SetRect	Standard Quickdraw function for Macintosh.	
TextList::init	See Section 2.19.5.15.1.	
ShowWait	See Section 2.22.1.45.1.	
nstallClock	See Section 2.22.1.6.4.	
MainEventLoop	See Section 2.19.2.1.2.	

Table 2.19-5 main Information.

2.19.2.1.2 MainEventLoop

MainEventLoop processes incoming events. The function call is MainEventLoop(). Table 2.19-6 describes the internal variables used and functions called using this function.

Internal Variables		
Variable	Type	Where Typedef Declared
myEvent	EventRecord	Development:THINK C: Mac #includes:EventMgr.h
eventpt	Point	Development:THINK C: Mac #includes:MacTypes.h
С	char	Standard C type.
astr	Str255	Development:THINK C: Mac #includes:MacTypes.h
i	short	Standard C type.
r	Rect	Development:THINK C: Mac #includes:MacTypes.h
r1	Rect	Development:THINK C: Mac #includes:MacTypes.h
wwindow	WindowPtr	Development:THINK C: Mac #includes:WindowMgr.h
windowcode	short	Standard C type.

Calls		
Function	Where Described	
SystemTask	Standard Desk Manager function for Macintosh.	
UpdateClock	See Section 2.22.1.6.2.	
ServiceObj::UpdateQs	See Section 2.19.5.11.6.	
GetNextEvent	Standard Toolbox Event Manager function for Macintosh.	
DoAbout	See Section 2.19.3.4.2.	
MacQuit	See Section 2.19.2.1.4.	
DoMenu	See Section 2.19.2.2.2.	
MenuKey	Standard Menu Manager function for Macintosh.	
HiliteMenu	Standard Menu Manager function for Macintosh.	
DoResourceStatus	See Section 2.19.3.8.1.	
FindWindow	Standard Window Manager function for Macintosh.	
MenuSelect	Standard Menu Manager function for Macintosh.	
SystemClick	Standard Desk Manager function for Macintosh.	
HiliteWindow	Standard Window Manager function for Macintosh.	
SelectWindow	Standard Window Manager function for Macintosh.	
SetPort	Standard Quickdraw function for Macintosh.	
GlobalToLocal	Standard Quickdraw function for Macintosh.	
Swindow::equal	See Section 2.19.5.13.8.	
ComWindow::CheckHotSpot	See Section 2.19.5.3.4.	
TextList::List1Click	See Section 2.19.5.15.12.	
Swindow::GetWindowPtr	See Section 2.19.5.13.10.	
TextList::GetCellRect	See Section 2.19.5.15.4.	
ZoomRect	See Section 2.22.1.47.2.	
ReviewSelection	See Section 2.19.3.2.15.	
NetworkEventHandler	See Section 2.22.1.3.5.	
	Called By	
Function	Where Described	
main	See Section 2.19.2.1.1.	

Table 2.19-6 MainEventLoop Information.

2.19.2.1.3 MacInits

MacInits intializes the SIMNET Combat Engineer Workstation application. The master pointers for handles in the Memory Manager are made, the system heap is grown, the event queue is flushed, and the quickdraw is intialized. The random number generator is seeded the pull-down menus are set up, the service queue is intialized, and the dialogs are set up. The function call is MacInits(). Table 2.19-7 describes the internal variables used and functions called using this function.

	Internal Var	iables
Variable	Type	Where Typedef Declared
i	short	Standard C type.
r	Rect	Development:THINK C: Mac #includes MacTypes.h

Calls		
Function	Where Described	
MoreMasters	Standard Memory Manager function for Macintosh.	
MaxApplZone	Standard Memory Manager function for Macintosh.	
FlushEvents	Standard Operating System Memory Manager function for Macintosh.	
InitGraf	Standard Quickdraw function for Macintosh.	
InitFonts	Standard Font Manager function for Macintosh.	
InitWindows	Standard Window Manager function for Macintosh.	
InitMenus	Standard Menu Manager function for Macintosh.	
TEInit	Standard TextEdit function for Macintosh.	
InitDialogs	Standard Dialog Manager function for Macintosh.	
InitCursor	Standard Quickdraw function for Macintosh.	
ZoomInit	See Section 2.22.1.47.1.	
helpinit	See Section 2.22.1.19.1.	
Notify	See Section 2.19.3.4.4.	
GetDateTime	Standard Operating System Utility function for Macintosh.	
SetUpMenus	See Section 2.19.2.2.1.	
ServiceObj::init	See Section 2.19.5.11.1.	
DialogWindow::init	See Section 2.19.5.5.1.	
DialogWindow::SetUserItem	See Section 2.19.5.5.13.	
	Called By	
Function	Where Described	
main	See Section 2.19.2.1.1.	

Table 2.19-7 MacInits Information.

2.19.2.1.4 MacQuit

MacQuit quits the SIMNET Combat Engineer Workstation application. The function call is MacQuit(). Table 2.19-8 describes the internal variables used and functions called using this function.

	Internal Variat	bles
Variable	Type	Where Typedef Declared
i	short	Standard C type.
	0-11-	
	Calls	
Function	Where Described	
TextList::ListDispose	See Section 2.19.5.15.3.	
Swindow::quit	See Section 2.19.5.13.3.	
ATPCloseSocket	Standard AppleTalk Manager function for Macintosh.	
ExitToShell	Standard Segment Lo	pader function for Macintosh.
	Called By	
Function	Where Described	
MainEventLoop	See Section 2.19.2.1.2.	
DoMenu	See Section 2.19.2.2.2.	

Table 2.19-8 MacQuit Information.

2.19.2.1.5 ProcessRequest

ProcessRequest processes a request received from the MCC host. *hdl* is the handle of the request from the host. The function call is ProcessRequest(hdl). Table 2.19-9 describes the parameters used and functions called using this function.

Parameters				
Parameter	Туре	Where Typedef Declared		
dl	register Handle	Development:THINK C:		
		Mac #includes:MacTypes.h		
Internal Variables				
/ariable	Туре	Where Typedef Declared		
)	register Ptr	Development:THINK C:		
		Mac #includes:MacTypes.h		
errCode	short	Standard C type.		
ouf	array of 100 char	Standard C type.		
empname	array of 255 char	Standard C type.		
ind	long	Standard C type.		
peed	short	Standard C type.		
cv	long	Standard C type.		
	short	Standard C type.		
oos	Str255	Development:THINK C:

ResourceObj::GetMission	See Section 2.19.5.9.5.			
//issionObj::GetStatus	See Section 2.19.5.7.21.			
/lissionObj::ResetMission Time	See Section 2.19.5.7.17.			
Restart	Standard Operating System Utility function for Macintosh.			
ime				

	Called By	
Function	Where Described	
main	See Section 2.19.2.1.1.	

Table 2.19-9 ProcessRequest Information.

2.19.2.1.6 GetTerrainBounds

GetTerrainBounds sends a message to the MCC host requesting information about the boundary limits of the CEW terrain. The function call is GetTerrainBounds(). Table 2.19-10 describes the internal variables used and functions called using this function.

Internal Variables			
Variable	Туре	Where Typedef Declared	
ab	register ABRecHandle	Development:THINK C: Mac #includes:Appletalk.h	
n	char	Standard C type.	
errCode	short	Standard C type.	
theBounds	CEWBoundsResponse	Development:SIMNET:CEW: CEW.h	
tempStr	Str255	Development:THINK C: Mac #includes:MacTypes.h	
	Calls		
Function	Where Described	Where Described	
NewHandle	Standard Memory Manager	Standard Memory Manager function for Macintosh.	
SetUpATPRequest	See Section 2.22.1.3.2.		
ATPError	See Section 2.22.1.3.6.	See Section 2.22.1.3.6.	
ATPResponse	Standard Appletalk Manage	Standard Appletalk Manager function for Macintosh.	
DisposHandle	Standard Memory Manager	Standard Memory Manager function for Macintosh.	
Notify	See Section 2.19.3.4.4.		

Table 2.19-10 GetTerrainBounds Information.

2.19.2.2 menus.c

Development:SIMNET:MCC:CEW:menus.c

menus.c contains routines that implement the menus for the CEW Macintosh console. Table 2.19-11 describes the variables used by menus.c.

Variables		
Variable	Type	Where Typedef Declared
comMenu	array of 5 MenuHandle	Development:THINK C: Mac #includes:MenuMgr.h
main_window	extern pointer to ComWindow	Development:SIMNET:CEW: ComWindows.h

Table 2.19-11 menus.c Variable Information.

2.19.2.2.1 SetUpMenus

SetUpMenus sets up the menu bar for the CEW console. The function call is SetUpMenus(). Table 2.19-12 describes the functions called using this function.

Calls		
Function	Where Described	
NewMenu	Standard Menu Manager function for Macintosh.	
AppendMenu	Standard Menu Manager function for Macintosh.	
AddResMenu	Standard Menu Manager function for Macintosh.	
InsertMenu	Standard Menu Manager function for Macintosh.	
GetMenu	Standard Menu Manager function for Macintosh.	
DrawMenuBar	Standard Menu Manager function for Macintosh.	
	Called By	
Function	Where Described	
MacInits	See Section 2.19.2.1.3.	

Table 2.19-12 SetUpMenus Information.

2.19.2.2.2 DoMenu

DoMenu handles menu selections. *menuresult* contains the specifiec menu ID, and the menu item. The function call is DoMenu(). Table 2.19-13 describes the parameters used and functions called using this function.

Parameters				
Parameter	Туре	Where Typedef Declared		
menuresult	long	Standard C type.		
	Internal Variables			
Variable	Type	Where Typedef Declared		
menuid	short	Standard C type.		
item	short	Standard C type.		
daname	array of 255 char	Standard C type.		
cport	GrafPtr	Development:THINK C: Mac #includes:Quickdraw.h		
refnum	short	Standard C type.		
	Calls			
Function Where Described				
HiWord	Standard Toolbox Utility	Standard Toolbox Utility function for Macintosh.		
LoWord	Standard Toolbox Utility	Standard Toolbox Utility function for Macintosh.		
GetItem	Standard Menu Manage	Standard Menu Manager function for Macintosh.		
GetPort	Standard Quickdraw fur	Standard Quickdraw function for Macintosh.		
OpenDeskAcc	Standard Desk Manage	Standard Desk Manager function for Macintosh.		
SetPort	Standard Quickdraw fur	Standard Quickdraw function for Macintosh.		
HiliteMenu	Standard Menu Manage	Standard Menu Manager function for Macintosh.		
DoAbout	See Section 2.19.3.4.2	See Section 2.19.3.4.2.		
MacQuit	See Section 2.19.2.1.4			
SysBeep	Standard Operating Sys	stem Uttility function for Macintosh.		
NotimpDialog		See Section 2.19.3.4.3.		

	Called By	
Function	Where Described	
MainEventLoop	See Section 2.19.2.1.2.	

Table 2.19-13 DoMenu Information.

2.19.3 Dialog Lists of Assets

2.19.3.1 CannedStuff.c

Development:SIMNET:MCC:CEW:CannedStuff.c

2.19.3.1.1 LoadCannedTerrainMap

LoadCannedTerrainMap loads in a canned terrain map for the demo version of the CEW. The function call is LoadCannedTerrainMap(). Table 2.19-14 describes the functions which call this function.

Called By		
Function	Where Described	
main	See Section 2.19.2.1.1.	

Table 2.19-14 LoadCannedTerrainMap Information.

2.19.3.1.2 LoadCannedResources

LoadCannedResources loads in a canned set of CEW assets for the demo version. The function call is LoadCannedResources(). Table 2.19-15 describes the internal variables used and functions called using this function.

Internal Variables		
Variable	Туре	Where Typedef Declared
i	short	Standard C type.
point	LongPt	Development:SIMNET:libmac: longpt.h
	Calls	
Function	Where Described	
ResourceObj::init	See Section 2.19.5.9.1.	
ResourceObj::SetPosition	See Section 2.19.5.9.4.	
ResourceObj::SetStatus	See Section 2.19.5.9.11.	
Called By		
Function	Where Described	
main	See Section 2.19.2.1.1.	

Table 2.19-15 LoadCannedResources Information.

2.19.3.2 CheckDialogs.c

Development:SIMNET:MCC:CEW:CheckDialogs.c

CheckDialogs.c contains routines for implementing dialogs. Table 2.19-16 describes the variables used by CheckDialogs.c.

Variables		
Variable	Туре	Where Typedef Declared
serviceq	extern pointer to ServiceObj	Development:SIMNET:CEW: ServiceObj.h
missionList	extern pointer to TextList	Development:SIMNET:CEW: TextList.h
emplacementPointArray	array of short	Standard C type.
legalGEMSSDensities	array of float	Standard C type.
time_modified	short	Standard C type.

Table 2.19-16 CheckDialogs.c Variable Information.

2.19.3.2.1 isLegalGEMSSDensity

isLegalGEMSSDensity determines if a density is a legal value for GEMSS vehicles. The function call is isLegalGEMSSDensity(dens). Table 2.19-17 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
dens	float	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
i	short	Standard C type.
	Return Values	
Return Value	Туре	Meaning
TRUE	long	Legal density value.
FALSE	long	Illegal density value.
	Called By	
Function	Where Described	
CheckEmplacementDialog	See Section 2.19.3.2.5.	

Table 2.19-17 is Legal GEMSS Density Information.

2.19.3.2.2 isLegalMinefield

isLegalMinefield determines if a minefield is of a legal shape. The function call is isLegalMinefield(). Table 2.19-18 describes the internal variables used and functions called using this function.

Internal Variables		
Variable	Туре	Where Typedef Declared
i	short	Standard C type.
pts	array of LongPt	Development:SIMNET:libmac: longpt.h
string	Str255	Development:THINK C: Mac #includes:MacTypes.h
	Return Values	
Return Value	Туре	Meaning
TRUE	short	Legal minefield.
FALSE	short	Illegal minefield.
	Calls	
Function	Where Described	
DialogWindow::GetText	See Section 2.19.5.5.7.	
UTMToLongPt	See Section 2.19.3.3.5.	
seg_intrsct	See Section 2.19.4.3.1.	
Notify	See Section 2.19.3.4.4.	
	Called By	
Function	Where Described	
CheckEmplacementDialog	See Section 2.19.3.2.5.	
DetermineMines	See Section 2.19.3.2.14.	

Table 2.19-18 isLegalMinefield Information.

2.19.3.2.3 ReviewDialogHandler

ReviewDialogHandler is a template for handling events in the Review dialogs. The routine is not called in the application. Table 2.19-19 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
dlog	pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h
event	EventRecord	Development:THINK C: Mac #includes:EventMgr.h

	Internal Variables	
Variable	Type	Where Typedef Declared
itemhit	short	Standard C type.
done	short	Standard C type.
lastitem	short	Standard C type.
С	char	Standard C type.
type	short	Standard C type.
Itype	short	Standard C type.
h_item	Handle	Development:THINK C: Mac #includes:MacTypes.h
lh_item	Handle	Development:THINK C: Mac #includes:MacTypes.h
box	Rect	Development:THINK C: Mac #includes:MacTypes.h
lbox	Rect	Development:THINK C: Mac #includes:MacTypes.h
reset	Boolean	Development:THINK C: Mac #includes:MacTypes.h
	Return Values	
Return Value	Туре	Meaning
START_MOVEMENT_NOW	short	Start the movement.
END MISSION NOW	short	End the mission.
START_ACTIVITY_NOW	short	Start the activity.
0	short	Do nothing; event was not a "hot key".
	Calls	
Function	Where Described	
SysBeep	Standard Operating System L	Itility function for Macintosh

Table 2.19-19 ReviewDialogHandler Information.

2.19.3.2.4 setEmplacementTime

setEmplacementTime calculates the amount of time it will take to emplace the minefield, given the assets information entered in the dialog specified by the *dialog* and *item* parameters. The function call is setEmplacementTime(dialogp, item). Table 2.19-20 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
dialogp	pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h
item	short	Standard C type.

Internal Variables		
Variable	Туре	Where Typedef Declared
item_time	DateTimeGroup	Development:SIMNET:libmac:
	1	dtg.h
gemss_number	short	Standard C type.
cewPlatoon_number	short	Standard C type.
m57_number	short	Standard C type.
move_time	float	Standard C type.
activity_time	float	Standard C type.
per_hr	float	Standard C type.
at	long	Standard C type.
apf	long	Standard C type.
apb	long	Standard C type.
i	short	Standard C type.
х	short	Standard C type.
retval	long	Standard C type.
string	Str255	Development:THINK C:
		Mac #includes:MacTypes.h
string2	Str255	Development:TH!NK C:
		Mac #includes:MacTypes.h
sm_time	long	Standard C type.
sa_time	long	Standard C type.
f_time	long	Standard C type.
	Return Values	
Return Value	Type	Meaning
retval	long	The amount time it will take to
		emplace the minefield.
	Calls	
Function	Where Described	
TextList::GetCount	See Section 2.19.5.15.5.	
ResourceObj::GetKind	See Section 2.19.5.9.2.	
DialogWindow::GetText	See Section 2.19.5.5.7.	
CheckList::GetState	See Section 2.19.5.1.6.	
StringToDTG	See Section 2.22.1.15.2.	
DTGElapsed	See Section 2.22.1.15.3.	
DTGToString	See Section 2.22.1.15.1.	
DialogWindow::SetText	See Section 2.19.5.5.8.	
	Called By	
Function	Where Described	
CheckEmplacementDialog	See Section 2.19.3.2.5.	
T. T	,	

Table 2.19-20 setEmplacementTime Information.

2.19.3.2.5 CheckEmplacementDialog

CheckEmplacementDialog checks the validity of data entered in the Emplacement Dialog fields. The shape of the minefield is checked, and the selected assets are checked. In addition, the routine performs calculations of the mission time and mine requirements. The function call is CheckEmplacementDialog(dialogp, item, to_reset, theEvent). Table 2.19-21 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
dialogp	pointer to DialogWindow	Development:SIMNET:CEW:
		Dialog_Windows.h
item	short	Standard C type.
to_reset	pointer to Boolean	Development:THINK C:
		Mac #includes:MacTypes.h
theEvent	pointer to EventRecord	Development:THINK C:
		Mac #includes:EventMgr.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
dtg	DateTimeGroup	Development:SIMNET:libmac: dtg.h
current_time	DateTimeGroup	Development:SIMNET:libmac:
		dtg.h
wp	DialogPtr	Development:THINK C:
		Mac #includes:DialogMgr.h

CheckList_Handler	See Section 2.19.3.7.2.	
CheckUTMString	See Section 2.19.3.3.1.	
HiliteWindow	Standard Window Manager function for Macintosh.	
SelectWindow	Standard Window Manager function for Macintosh.	
SetPort	Standard Quickdraw function for Macintosh.	
DialogWindow::SelectText	See Section 2.19.5.5.9.	
ToUpper	Macro defined in Development:SIMNET:CEW:CheckDialogs.c.	
CheckDTGString	See Section 2.19.3.3.2.	
NotImpDialog	See Section 2.19.3.4.3.	

Table 2.19-21 CheckEmplacementDialog Information.

2.19.3.2.6 setBreachTime

serBreachTime calculates the amount of time it will take to breach a lane, given the assets information entered in the dialog by the user. The dialog is specified by the *dialog* and *item* parameters. The function call is setBreachTime(dialogp, item). Table 2.19-22 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
dialogp	pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h
item	short	Standard C type.

Internal Variables		
Variable	Туре	Where Typedef Declared
end_pt	LongPt	Development:SIMNET:libmac: longpt.h
start_pt	LongPt	Development:SIMNET:libmac: longpt.h
lineCharge_number	short	Standard C type.
area	long	Standard C type.
move_time	float	Standard C type.
activity_time	float	Standard C type.
i	short	Standard C type.
retval	long	Standard C type.
length	long	Standard C type.
string	Str255	Development:THINK C: Mac #includes:MacTypes.h
string2	Str255	Development:THINK C: Mac #includes:MacTypes.h
item_time	DateTimeGroup	Development:SIMNET:libmac: dtg.h
sm_time	long	Standard C type.
sa_time	long	Standard C type.
f_time	long	Standard C type.
charges	float	Standard C type.
	Return Values	
Return Value	Type	Meaning
retval	long	The amount of time it will take to breach the lane.

Table 2.19-24 CheckMoveDialog Information.

2.19.3.2.9 CheckMissionTypeDialog

CheckMissionTypeDialog checks for validity of user input in the Mission Type Dialog. The OK button, Emplace Button, Breach button, and Move button are enabled. The Mission Type dialog allows the user to choose whether the mission is an Emplacement, Breach, or Move Mission. The function call is CheckMissionTypeDialog(dialogp, item, to_reset, theEvent). Table 2.19-25 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
dialogp	pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h
item	short	Standard C type.
to_reset	pointer to Boolean	Development:THINK C: Mac #includes:MacTypes.h
theEvent	pointer to EventRecord	Development:THINK C: Mac #includes:EventMgr.h

	Return Va	lues
Return Value	Type	Meaning
TRUE	short	Data is accepted; user is allowed to continue.
FALSE	short	Data is not accepted; the dialog cannot be brought down.

Table 2.19-25 CheckMissionTypeDialog Information.

2.19.3.2.10 CheckStatEmplacementDialog

CheckStatEmplacementDialog checks for changes made in the Emplacement dialog. This function is not currently called by the application. The function call is CheckStatEmplacementDialog(dialogp, item, to_reset, theEvent). Table 2.19-26 describes the parameters used and functions called using this function.

Parameters				
Parameter	Туре	Where Typedef Declared		
dialogp	pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h		
item	short	Standard C type.		
to_reset	pointer to Boolean	Development:THINK C: Mac #includes:MacTypes.h		
theEvent	pointer to EventRecord	Development:THINK C: Mac #includes:EventMgr.h		
	Return Values			
Return Value				
TRUE	short	The changes are valid.		
FALSE	short	The changes are not valid.		
	Calls			
Function	Where Described			
CheckList_Handler	See Section 2.19.3.7.2.			
NotImpDialog	See Section 2.19.3.4.3.			

Table 2.19-26 CheckStatEmplacementDialog Information.

2.19.3.2.11 CheckStatBreachDialog

CheckStatBreachDialog checks for changes made in the Breach dialog. This function is not currently called by the application. The function call is CheckStatBreachDialog(dialogp, item, to_reset, theEvent). Table 2.19-27 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
dialogp	pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h
item	short	Standard C type.
to_reset	pointer to Boolean	Development:THINK C: Mac #includes:MacTypes.h
theEvent	pointer to EventRecord	Development:THINK C: Mac #includes:EventMgr.h
	Return Values	
Return Value	Туре	Meaning
TRUE	short	The changes are valid.
FALSE	short	The changes are invalid.
	Calls	
Function	Where Described	
CheckList_Handler	See Section 2.19.3.7.2.	
NotImpDialog	See Section 2.19.3.4.3.

2.19.3.2.14 DetermineMines

DetermineMines determines the number of mines it would take to make the given density of minefield that the user entered. The user entered data is located in the dialog specified by the parameters, dialogp and item. The function call is DetermineMines(dialogp, item). Table 2.19-30 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
dialogp	pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h
item	short	Standard C type.

2.19.3.2.15 ReviewSelection

ReviewSelection sets up the Review dialogs. The review dialogs show a mission (specified by the mission number *num*) to the user. The routine allows the user access to the mission data based on the status of the mission. If the mission is in progress, the user may only show the mission for review. If the mission is not in progress, the user may either show the mission, edit the mission, or abort the mission. The routine also handles the use of "hot keys" to expedite missions. TRUE is returned if the selection was successfully handled. FALSE is returned if the user attempts an illegal event, i.e. trying to force an aborted mission to execute. The function call is ReviewSelection(num). Table 2.19-31 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
num	short	Standard C type.	
	· · · · · · · · · · · · · · · · · · ·	_	
	Internal Variables		
Variable	Туре	Where Typedef Declared

Development:SIMNET:MCC:CEW:DialogFieldSupport.c

This file provides routines used to check dialog fields data.

2.19.3.3.1 CheckUTMString

CheckUTMString checks the validity of the UTM coordinate passed in the parameter, utmstring. The function call is CheckUTMString(utmstring). Table 2.19-32 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
utmstring	UTMCoordinates	Development:SIMNET:CEW: SimnetTypes.h	
	Internal Variables		
Variable	Type	Where Typedef Declared	
cStr	pointer to char	Standard C type.	
map	MapCoordinates	Development:SIMNET:libmac: map.h	
tempStr	Str255	Development:THINK C: Mac #includes:MacTypes.h	
outStr	Str255	Development:THINK C: Mac #includes:MacTypes.h	
result	short	Standard C type.	
	Return Values		
Return Value	Туре	Meaning	
TRUE	short	Valid UTM string.	
FALSE	short	Invalid UTM string.	
	Calls		
Function	Where Described		
stpcpy	See Section 2.19.3.10.3.

2.19.3.3.2 CheckDTGString

CheckDTGString checks the validity of the DTG string passed in the parameter, dtgstring. The function call is CheckDTGString(dtgstring). Table 2.19-33 describes the parameters used, errors returned and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
dtgstring	pointer to char	Standard C type.	
	Internal Variables		
Variable	Type	Where Typedef Declared	
dtg	DateTimeGroup	Development:SIMNET:libmac: dtg.h	
tempStr	array of 255 char	Standard C type.	
cStr	char	Standard C type.	
result	short	Standard C type.	
	Return Values	_	
Return Value	Туре	Meaning	
TRUE	short	Valid DTG string.	
FALSE	short	Invalid DTG string.	
	Errors		
Error Name	Reason for Error		
DTG_SUCCESS		Valid DTG string.	
DTG_ERROR	Incorrect date time group.		
DTG_BAD_DAY	Wrong day.		
DTG_BAD_HOUR	Wrong hour.		
DTG_BAD_MINUTE	Wrong minute.

2.19.3.3.3 CheckvsCurrentTime

CheckvsCurrentTime compares the time passed in the parameter, dtg, with the current time. If dtg is later than or equal to the current time, TRUE is returned. If dtg is earlier than the current time, FALSE is returned. The function call is CheckvsCurrentTime(dtg). Table 2.19-34 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
dtg	DateTimeGroup	Development:SIMNET:libmac: dtg.h

	Internal Variable	es
Variable	Туре	Where Typedef Declared
now	unsigned long	Standard C type.
	Return Values	
Return Value	Type	Meaning
TRUE	short	dtg is later than or equal to the current time.

Time				
MissionObj::SendEmplace ment	See Section 2.19.5.7.27.			
MissionObj::SendBreach	See Section 2.19.5.7.28.			
ResourceObj::DistanceToSec s	See Section 2.19.5.9.9.			

Table 2.19-36 UTMToLongPt Information.

2.19.3.3.6 GetDisTime

GetDisTime calculates the amount of time it takes to travel between two given points, start_pt and end_pt, at a given speed, kph. The function call is GetDisTime(start_c, end_c, kph). Table 2.19-37 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
start_c	pointer to char	Standard C type.
end_c	pointer to char	Standard C type.
kph	short	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
start_pt	LongPt	Development:SIMNET:libmac: longpt.h
end_pt	LongPt	Development:SIMNET:libmac: longpt.h
speed	float	Standard C type.
dis	long	Standard C type.
	Datum Value	<u> </u>
Salara Matri	Return Values	1.0
Return Value	Туре	Meaning
dis	long	The amount of time it takes to travel the given distance at the given speed.
	Calls	
Function	Where Described	
UTMToLongPt	See Section 2.19.3.3.5.	
DistBetween2Pts	See Section 2.22.1.23.2.	

Table 2.19-37 GetDisTime Information.

2.19.3.4 DoAbout.c

Development:SIMNET:MCC:CEW:DoAbout.c

This file contains routines for handling alerts.

2.19.3.4.1 SetParamText

SetParamText sets the text fields for an alert. The parameter, strNum, is the index to a standard text string. The function call is SetParamText(strNum). Table 2.19-38 describes the parameters used and functions called using this function.

Parameter	Type	Where Typedef Declared
strNum	short	Standard C type.

Internal Variables			
Variable	Type	Where Typedef Declared	
h	StringHandle	Development:THINK C: Mac #includes:MacTypes.h	
	Calls		
Function	Where Described		
GetString	Standard Toolbox Utilit	Standard Toolbox Utility function for Macintosh.	
HLock	Standard Memory Man	Standard Memory Manager function for Macintosh.	
ParamText	Standard Dialog Manag	Standard Dialog Manager function for Macintosh.	
HUnlock	Standard Memory Man	ager function for Macintosh.	
	Called By		
Function			
DoAbout	See Section 2.19.3.4.	2.	
NotImpDialog	See Section 2.19.3.4.3.		

Table 2.19-38 SetParamText Information.

2.19.3.4.2 DoAbout

DoAbout implements the "About..." selection in the Macintosh apple menu. The function call is DoAbout(). Table 2.19-39 describes the functions called using this function.

Calls		
Function	Where Described	
SetParamText	See Section 2.19.3.4.1.	
Alert Standard Dialog Manager function for Macintosh.		
	Called By	
Function	Where Described	
MainEventLoop	See Section 2.19.2.1.2.	
DoMenu	See Section 2.19.2.2.2.	

Table 2.19-39 DoAbout Information.

2.19.3.4.3 NotImpDialog

NotImpDialog implements the "This function not implemented" dialog. The function call is NotImpDialog(). Table 2.19-40 describes the functions called using this function.

Calls		
Function	Where Described	
SetParamText	See Section 2.19.3.4.1.	
Alert Standard Dialog Manager function for Macintosh.		

Called By		
Function	Where Described	
DoMenu	See Section 2.19.2.2.2.	
CheckEmpiacementDialog	See Section 2.19.3.2.5.	
CheckBreachDialog	See Section 2.19.3.2.7.	
CheckMoveDialog	See Section 2.19.3.2.8.	
CheckStatEmplacementDialo	See Section 2.19.3.2.10.	
CheckStatBreachDialog	See Section 2.19.3.2.11.	
CheckStatMoveDialog	See Section 2.19.3.2.12.	
MainHelpButton	See Section 2.19.3.5.5.	
HelpStatus	See Section 2.19.3.8.6.	

Table 2.19-40 NotImpDialog Information.

2.19.3.4.4 Notify

Notify fills in an alert and notifies the user of a problem. The alert is filled in with the string passed in *str*. The function call is Notify(str). Table 2.19-41 describes the parameters used and functions called using this function.

	Paramet	ers
Parameter	Туре	Where Typedef Declared
str	Ptr	Development:THINK C: Mac #includes:MacTypes.h
	Calls	
Function	Where Describe	ed
ParamText	Standard Dialog Manager function for Macintosh.	
	Standard Dialog Manager function for Macintosh.	

Called By		
Function	Where Described	
main	See Section 2.19.2.1.1.	
MacInits	See Section 2.19.2.1.3.

ServiceObj::CheckQs	See Section 2.19.5.11.4.	

Table 2.19-41 Notify Information.

2.19.3.4.5 MySound

MySound makes a noise to alert the user. *num* is the index of the sound to make. The function call is MySound(num). Table 2.19-42 describes the parameters used and functions called using this function.

	Parameters	· · · · · · · · · · · · · · · · · · ·
Parameter	Туре	Where Typedef Declared
num	short	Standard C type.
	Calls	
Function	Where Described	
SysBeep	Standard Operating Sy	stem Utility function for Macintosh.
	Called By	
Function	Where Described	
ServiceObj::CheckQs	See Section 2.19.5.11	1.4.

Table 2.19-42 MySound Information.

2.19.3.5 HotSpots.c

Development:SIMNET:MCC:CEW:HotSpots.c

This file contains button handling routines. Table 2.19-43 describes the variables used by HotSpots.c.

Variables		
Variable	Туре	Where Typedef Declared
cewMission	extern pointer to array of MissionObj	Development:SIMNET:CEW: MissionObj.h
nextMission	extern short	Standard C type.
select_dlog	extern pointer to DialogWindow	Development:SIMNET:CEW: Dialog Windows.h
main_window	extern pointer to ComWindow	Development:SIMNET:CEW: ComWindows.h
serviceq	extern pointer to ServiceObj	Development:SIMNET:CEW: ServiceObj.h

Table 2.19-43 HotSpots.c variables Information.

2.19.3.5.1 indone

indone is the prototype routine (or template) used to model other button handling routines in this file.

Parameters					
Parameter	Туре	Where Typedef Declared			
cw	pointer to ComWindow	Development:SIMNET:CEW:			
		ComWindows.h			
xpoint	Point	Development:THINK C:			
	<u>,</u>	Mac #includes:MacTypes.h			
r	Rect	Development:THINK C:			
		Mac #includes:MacTypes.h			
	Internal Variables				
Variable	Type	Where Typedef Declared			
aevent	EventRecord	Development:THINK C:			
		Mac #includes:EventMgr.h			
eventpt	Point	Development:THINK C:			
		Mac #includes:MacTypes.h			
	Return Values				
Return Value	Туре	Meaning			
TRUE	short	The user has requested an			
		action			
FALSE	short	The user has not requested			
		an action.			
	Calls				
Function	Where Described	Where Described			
PtInRect		Standard Quickdraw function for Macintosh.			
InvertRect	Standard Quickdraw function	Standard Quickdraw function for Macintosh.			
GetNextEvent	Standard Toolbox Event Ma	Standard Toolbox Event Manager function for Macintosh.			
GlobalToLocal	Standard Quickdraw function for Macintosh.				

Table 2.19-44 indone Information.

2.19.3.5.2 MissionButton

MissionButton is called when the user clicks the mouse in the New Mission button. The new mission series is brought up. The function call is MissionButton(cw, r, xpoint). Table 2.19-45 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
cw	pointer to ComWindow	Development:SIMNET:CEW: ComWindows.h
xpoint	Point	Development:THINK C: Mac #includes:MacTypes.h
r	Rect	Development:THINK C: Mac #includes:MacTypes.h
	Internal Variables	
Variable	Type	Where Typedef Declared
r1	Rect	Development:THINK C: Mac #includes:MacTypes.h
aevent	EventRecord	Development:THINK C: Mac #includes:EventMgr.h
eventpt	Point	Development:THINK C: Mac #includes:MacTypes.h
	Return Values	
Return Value	Type	Meaning
TRUE	short	The user requested the new mission dialog.
FALSE	short	The user did not request the new mission dialog.
	Calls	
Function	Where Described	
PtInRect	Standard Quickdraw function for Macintosh.	
InvertRect	Standard Quickdraw function for Macintosh.	
GetNextEvent	Standard Toolbox Event Manager function for Macintosh.	
GlobalToLocal	Standard Quickdraw function for Macintosh.	
SetRect	Standard Quickdraw function for Macintosh.	
LocalRectToGlobal	See Section 2.19.3.10.1.	
ZoomRect	See Section 2.22.1.47.2.	
MissionSelection	See Section 2.19.3.5.3.	

Table 2.19-45 MissionButton Information.

2.19.3.5.3 MissionSelection

MissionSelection handles the user's selection of the mission type. The choices of mission types are the Emplacement Mission, Breach Mission, or Move Mission. The function call is MissionSelection(). Table 2.19-46 describes the internal variables used and functions called using this function.

Internal Variables			
Variable	Туре	Where Typedef Declared	
lastButton	short	Standard C type.	
thisMission	short	Standard C type.	
status	short	Standard C type.	
missionType	short	Standard C type.	
	Calls		
Function	Where Described		
DialogWindow::activate	See Section 2.19.5.5.3.		
Swindow::update	See Section 2.19.5.13.4.		
MissionObj::init	See Section 2.19.5.7.1.		
MissionObj::NewMission	See Section 2.19.5.7.3.		
-			
	Called By		
Function	Where Described		
MissionButton	See Section 2.19.3.5.2.		

Table 2.19-46 MissionSelection Information.

2.19.3.5.4 StatusButton

StatusButton is called when the user clicks the mouse in the Asset Status button. The list of assets and their status is brought up. The function call is StatusButton(cw, r, xpoint). Table 2.19-47 describes the parameters used and functions called using this function.

Parameters		
Type	Where Typedef Declared	
pointer to ComWindow	Development:SIMNET:CEW: ComWindows.h	
Point	Development:THINK C: Mac #includes:MacTypes.h	
Rect	Development:THINK C: Mac #includes:MacTypes.h	
Internal Variables		
Туре	Where Typedef Declared	
Rect	Development:THINK C: Mac #includes:MacTypes.h	
EventRecord	Development:THINK C: Mac #includes:EventMgr.h	
Point	Development:THINK C: Mac #includes:MacTypes.h	
Return Values		
Type	Meaning	
short	The user requested the Asset Status list.	
short	The user did not request the Asset Status list.	
	Type pointer to ComWindow Point Rect Internal Variables Type Rect EventRecord Point Return Values Type short	

Calls		
Function	Where Described	
PtInRect	Standard Quickdraw function for Macintosh.	
InvertRect	Standard Quickdraw function for Macintosh.	
GetNextEvent	Standard Toolbox Event Manager function for Macintosh.	
GlobalToLocal	Standard Quickdraw function for Macintosh.	
DoResourceStatus	See Section 2.19.3.8.1.	

Table 2.19-47 StatusButton Information.

2.19.3.5.5 MainHelpButton

MainHelpButton is called when the user clicks the mouse in the Main Help button. Since the Main Help dialog is not implemented, the "This dialog not implemented" dialog is brought up. The function call is MainHelpButton(cw, r, xpoint). Table 2.19-48 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
CW	pointer to ComWindow	Development:SIMNET:CEW:	
		ComWindows.h	
xpoint	Point	Development:THINK C:	
		Mac #includes:MacTypes.h	
r	Rect	Development:THINK C:	
		Mac #includes:MacTypes.h	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
r1	Rect	Development:THINK C:	
		Mac #includes:MacTypes.h	
aevent	EventRecord	Development:THINK C:	
		Mac #includes:EventMgr.h	
eventpt	Point	Development:THINK C:	
<u> </u>		Mac #includes:MacTypes.h	
	Return Values		
Return Value	Туре	Meaning	
TRUE	short	The user requested the main	
	_	help dialog.	
FALSE	short	The user did not request the	
		main help dialog.	
	Calls		
Function	Where Described		
PtInRect	Standard Quickdraw function for Macintosh.		
InvertRect	Standard Quickdraw function for Macintosh.		
GetNextEvent	Standard Toolbox Event Manager function for Macintosh.		
GlobalToLocal	Standard Quickdraw function for Macintosh.		
NotImpDialog	See Section 2.19.3.4.3.		

Table 2.19-48 MainHelpButton Information.

2.19.3.6 Refresh.c

Development:SIMNET:MCC:CEW:Refresh.c

This file contains a routine which implements the initial window in the CEW Console.

Variables		
Variable	Туре	Where Typedef Declared
missionList	extern pointer to TextList	Development:SIMNET:CEW: TextList.h
mainCTL	ControlHandle	Development:THINK C: Mac #includes:ControlMgr.h
resCtl	ControlHandle	Development:THINK C: Mac #includes:ControlMgr.h
m_helpCTL	ControlHandle	Development:THINK C: Mac #includes:ControlMgr.h

Table 2.19-49 Refresh.c Variable Information.

2.19.3.6.1 PrintWindow

PrintWindow sets up the initial window containing the mission table. The mission table text headings are filled in and the buttons are set up and displayed. The parameter window specifies the window containing the mission table. The function call is PrintWindow(window). Table 2.19-50 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
window	pointer to ComWindow	Development:SIMNET:CEW: ComWindows.h	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
٢	Rect	Development:THINK C:	
		Mac #includes:MacTypes.h	
	Calls		
Function	Where Described	Where Described	
Swindow::lsVisible	See Section 2.19.5.13.6.		
TextFont	Standard Quickdraw function for Macintosh.		
TextSize	Standard Quickdraw function for Macintosh.		
MoveTo	Standard Quickdraw function for Macintosh.		
DrawString	Standard Quickdraw function for Macintosh.		
SetRect	Standard Quickdraw function for Macintosh.		
NewControl	Standard Control Manager function for Macintosh.		
Swindow::GetWindowPtr	See Section 2.19.5.13.10.		
ComWindow::AddHotSpot	See Section 2.19.5.3.2.		
DrawControls	Standard Control Manager function for Macintosh.		
OutLineRect	See Section 2.19.3.10.5.		
FrontWindow	Standard Window Manager	Standard Window Manager function for Macintosh.	
ReDrawClock	See Section 2.22.1.6.3.		

Table 2.19-50 PrintWindow Information.

2.19.3.7 ResItem.c

Development:SIMNET:MCC:CEW:ResItem.c

This file implements the lists of resources (or assets) which can be used on missions.

Variables		
Variable	Туре	Where Typedef Declared
breach_availList	pointer to CheckList	Development:SIMNET:CEW: CheckList.h
move_availList	pointer to CheckList	Development:SIMNET:CEW: CheckList.h
emplace_availList	pointer to CheckList	Development:SIMNET:CEW: CheckList.h
stat_emplace_availList	pointer to CheckList	Development:SIMNET:CEW: CheckList.h
stat_breach_availList	pointer to CheckList	Development:SIMNET:CEW: CheckList.h
stat_move_availList	pointer to CheckList	Development:SIMNET:CEW: CheckList.h
main_window	extern pointer to ComWindow	Development:SIMNET:CEW: ComWindows.h
emplace_dlog	extern pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h
breach_dlog	extern pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h
move_dlog	extern pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h
stat_emplace	extern pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h
stat_breach	extern pointer to DialogWindow	Development:SIMNET:CEW: Dialog Windows.h
stat_move	extern pointer to DialogWindow	Development:SIMNET:CEW: Dialog Windows.h
cewResources	extern pointer to array of ResourceObj	Development:SIMNET:CEW: ResourceObj.h
totalResources	extern short	Standard C type.

Table 2.19-51 resItem.c Variable Information.

2.19.3.7.1 ResourceItems

ResourceItems updates the list of resources used on the specified mission. Resources may only be allocated to one mission. The parameter wp specifies which type of mission dialog (emplace, breach, move, etc.), and i is the index to a specific mission within the mission list. The function call is ResourceItems(wp, i). Table 2.19-52 describes the parameters used and functions called using this function.

	Parameter	S
Parameter	Туре	Where Typedef Declared
wp	WindowPtr	Development:THINK C: Mac #includes:WindowMgr.h
i	short	Standard C type.

Internal Variables			
Variable	Туре	Where Typedef Declared	
r	Rect	Development:THINK C: Mac #includes:MacTypes.h	
tempStr	Str255	Development:THINK C: Mac #includes:MacTypes.h	
X	short	Standard C type.	
	Calls		
Function	Where Described		
DialogWindow::equal	See Section 2.19.5.5.15.		
DialogWindow::GetItemRect	See Section 2.19.5.5.14.		
CheckList::init	See Section 2.19.5.1.1.		
ResourceObj::GetName	See Section 2.19.5.9.10		
CheckList::AddRow	See Section 2.19.5.1.2.		
TextList::ListUpdate	See Section 2.19.5.15.2.		
CheckList::GetState	See Section 2.19.5.1.6.		

Table 2.19-52 ResourceItems Information.

2.19.3.7.2 CheckList Handler

CheckList_Handler handles events in the list of Resources (or assets). When the mouse is clicked on a resource, the resource state is toggled to either selected or not selected. The parameter availList points to the available resources list. theEvent points to the resource row in the list. state is the state of that resource. The function call is CheckList_Handler(availList, theEvent, state). Table 2.19-53 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
availList	pointer to CheckList	Development:SIMNET:CEW: CheckList.h
theEvent	pointer to EventRecord	Development:THINK C: Mac #includes:EventMgr.h
state	short	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
eventpt	Point	Development:THINK C: Mac #includes:MacTypes.h
where	short	Standard C type.
	Calls	
Function	Where Described	
GlobalToLocal	Standard Quickdraw function for Macintosh.	
TextList::List1Click	See Section 2.19.5.15.12.	
CheckList::ToggleState	See Section 2.19.5.1.7.	

Called By		
Function	Where Described	
CheckEmplacementDialog	See Section 2.19.3.2.5.	
CheckBreachDialog	See Section 2.19.3.2.7.	
CheckMoveDialog	See Section 2.19.3.2.8.	
CheckStatEmplacementDialo	See Section 2.19.3.2.10.	
CheckStatBreachDialog	See Section 2.19.3.2.11.	
CheckStatMoveDialog	See Section 2.19.3.2.12.	

Table 2.19-53 CheckList_Handler Information.

2.19.3.7.3 DeleteResourceLists

DeleteResourceLists deletes all available resource lists. The function call is DeleteResourceLists(). Table 2.19-54 describes the functions called using this function.

Calls		
Function	Where Described	
TextList::ListDispose	See Section 2.19.5.15.3.	
DialogWindow::quit	See Section 2.19.5.5.4.	

Table 2.19-54 DeleteResourceLists Information.

2.19.3.8 ResStatusWindow.c

Development:SIMNET:MCC:CEW:ResStatusWindow.c

ResStatusWindow.c implements the available resource status list dialog windows.

	Variables		
Variable	Type	Where Typedef Declared	
resource_window	pointer to ComWindow	Development:SIMNET:CEW: ComWindows.h	
resList	pointer to TextList	Development:SIMNET:CEW: TextList.h	
exitCT _' _	ControlHandle	Development:THINK C: Mac #includes:ControlMgr.h	
helpCTL	ControlHandle	Development:THINK C: Mac #includes:ControlMgr.h	
main_window	extern pointer to ComWindow	Development:SIMNET:CEW: ComWindows.h	
cewResources	extern pointer to array of ResourceObj	Development:SIMNET:CEW: ResourceObj.h	
totalResources	extern short	Standard C type.	

Table 2.19-55 ResStatusWindow.c Variable Information.

2.19.3.8.1 DoResourceStatus

DoResourceStatus implements the Resource Status window. When the user clicks the mouse on the Asset Status button the Resource Status window appears with a list of Resources (or Assets) with their current locations and states. The function call is DoResourceStatus(). Table 2.19-56 describes the functions called using this function.

Calls		
Function	Where Described	
SetupResWindow	See Section 2.19.3.8.2.	
OtherEventLoop	See Section 2.19.3.8.7.	
ResCleanUp	See Section 2.19.3.8.8.	
	Called By	
Function	Where Described	
MainEventLoop	See Section 2.19.2.1.2.	
StatusButton	See Section 2.19.3.5.4.	

Table 2.19-56 DoResourceStatus Information.

2.19.3.8.2 SetupResWindow

SetupResWindow sets up the window of lists of Resources (or Assets). The function call is SetupResWindow(). Table 2.19-57 describes the internal variables used and functions called using this function.

Internal Variables			
Variable	Туре	Where Typedef Declared	
r	Rect	Development:THINK C:	
		Mac #includes:MacTypes.h	
tempStr	Str255	Development:THINK C:	
		Mac #includes:MacTypes.h	
i	short	Standard C type.	
	Calls		
Function	Where Described		
ComWindow::initial	See Section 2.19.5.3.3.		
ComWindow::show	See Section 2.19.5.3.1.		
SetRect	Standard Quickdraw function	for Macintosh	
NewControl	Standard Control Manager function for Macintosh.		
Swindow::GetWindowPtr	See Section 2.19.5.13.10.		
ComWindow::AddHotSpot	See Section 2.19.5.3.2.		
OutLineRect	See Section 2.19.3.10.5.		
TextList::init	See Section 2.19.5.15.1.		
HeadingSetUp	See Section 2.19.3.8.4.		
ResourceObj::show	See Section 2.19.5.9.13.		
ResourceObj::GetStatus	See Section 2.19.5.9.12.		
ResourceObj::GetMission	See Section 2.19.5.9.5.		
TextList::AddRow	See Section 2.19.5.15.6.		
Eumotion	Called By		
Function De Personne Status	Where Described		
DoResourceStatus	See Section 2.19.3.8.1.		

Table 2.19-57 SetupResWindow Information.

2.19.3.8.3 RefreshWindow

RefreshWindow refreshes the screen specified by the parameter window. The function call is RefreshWindow(window). Table 2.19-58 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
window	pointer to ComWindow	Development:SIMNET:CEW: ComWindows.h	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
٢	Rect	Development:THINK C: Mac #includes:MacTypes.h	
	Calls		
Function	Where Described		
Swindow::lsVisible	See Section 2.19.5.13.6.		
HeadingSetUp	See Section 2.19.3.8.4.		
TextList::ListUpdate	See Section 2.19.5.15.2.		
DrawControls	Standard Control Manager function for Macintosh.		
Swindow::GetWindowPtr	See Section 2.19.5.13.10.		
OutLineRect	See Section 2.19.3.10.5.		

Table 2.19-58 RefreshWindow Information.

2.19.3.8.4 HeadingSetUp

HeadingSetUp lists the heading titles in the window. The function call is HeadingSetUp(). Table 2.19-59 describes the functions called using this function.

Calls		
Function	Where Described	
TextFont	Standard Quickdraw function for Macintosh.	
TextSize	Standard Quickdraw function for Macintosh.	
MoveTo	Standard Quickdraw function for Macintosh.	
DrawString	Standard Quickdraw function for Macintosh.	
	Called By	
Function	Where Described	
SetupResWindow	See Section 2.19.3.8.2.	
RefreshWindow	See Section 2.19.3.8.3.	

Table 2.19-59 HeadingSetUp Information.

2.19.3.8.5 DoneStatus

DoneStatus puts up the mission window when the user is done with the Resource Status window. cw points to the Resource Status Window; xpoint is the location of the mouse click; r is outline of the Done button. The function call is DoneStatus(cw, r, xpoint). Table 2.19-60 describes the parameters used and functions called using this function.

	Parameters		
Parameter	Туре	Where Typedef Declared	
cw	pointer to ComWindow	Development:SIMNET:CEW:	
		ComWindows.h	
xpoint	Point	Development:THINK C:	
		Mac #includes:MacTypes.h	
r	Rect	Development:THINK C:	
		Mac #includes:MacTypes.h	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
eventpt	Point	Development:THINK C:	
		Mac #includes:MacTypes.h	
X	short	Standard C type.	
	Return Values		
Return Value	Туре	Meaning	
TRUE	short	The user clicked on the Done button; the Resource Status window is put away and the Mission window is brought back.	
FALSE	short	The user did not click on the Done button.	
	Calls		
Function		Where Described	
PtInRect	Standard Quickdraw functio	Standard Quickdraw function for Macintosh.	
TrackControl	Standard Control Manager f	Standard Control Manager function for Macintosh.	
TextList::ListDispose	See Section 2.19.5.15.3.		
KillControls		Standard Control Manager function for Macintosh.	
Swindow::GetWindowPtr	See Section 2.19.5.13.10.		
Swindow::quit	See Section 2.19.5.13.3.		

Table 2.19-60 DoneStatus Information.

2.19.3.8.6 HelpStatus

HelpStatus puts up the Help window when the user clicks on the Help button. Note that the Help window is not implemented. cw points to the current window; xpoint is the location of the mouse click; r is the rectangle outlining the Help button. The function call is HelpStatus(cw, r, xpoint). Table 2.19-61 describes the parameters used and functions called using this function.

	Parameters		
Parameter	Туре	Where Typedef Declared	
cw	pointer to ComWindow	Development:SIMNET:CEW: ComWindows.h	
xpoint	Point	Development:THINK C: Mac #includes:MacTypes.h	
r	Rect	Development:THINK C: Mac #includes:MacTypes.h	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
eventpt	Point	Development:THINK C:	
		Mac #includes:MacTypes.h	
X	short	Standard C type.	
	Return Values		
Return Value	Туре	Meaning	
TRUE	short	The user clicked on the Help button.	
FALSE	short	The user did not click on the Help button.

2.19.4 Minefield Geometry

2.19.4.1 poly area.c

Development:SIMNET:MCC:CEW:poly_area.c

This file contains routines used to calculate the area of a user created minefield, given the coordinates of the polygon's vertices.

Variables		
Variable	Type	Where Typedef Declared
errString	Str255	Development:THINK C: Mac #includes:MacTypes.h

Table 2.19-79 poly_area.c Variable Information.

2.19.4.1.1 poly area

poly_area computes the area of a polygon. This routine sets up a data structure called new_verts, then calls the routine poly_area_loc() to perform the area calculation.

num_verts is the number of vertices; verts is the array of vertices (x,y) coordinates; areap is filled in with the area by poly_area_loc(). It is assumed that the distinct vertices are listed

without repeating the first one at the end (verts[0] to verts[num_verts - 1], with the last vertex not equal to the first). It is also assumed that the polygon has no self-shortersections. Note that this routine does not work well if the polygon has vertices in a row. The function call is poly_area(verts, num_verts, areap). Table 2.19-80 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
verts	pointer to LongPt	Development:SIMNET:libmac: longpt.h	
num_verts	short	Standard C type.	
areap	pointer to double	Standard C type.	
··-	Internal Variables	8	
Variable	Type	Where Typedef Declared	
code	short	Standard C type.

	Called By		
Function	Where Described	***************************************	
DetermineMines	See Section 2.19.3.2.14		

Table 2.19-80 poly area Information.

2.19.4.1.2 poly_area_loc

poly_area_loc calculates the area of the polygon, where *verts* is the array of vertices (x,y) coordinates and num_verts is the number of vertices. areap is filled in with the area of the polygon. The routine first checks that the parameters define an actual polygon. If the polygon is a triangle $(num_verts = 3)$, its area is calculated and filled into areap.

If the polygon is made up of more than three vertices, the routine calculates its area as follows: A triangle is created from the first three vertices: verts[vert-1], verts[vert], and verts[vert+1]. If no other vertex of the polygon is within this triangle and the triangle is located on the inside of the polygon, the triangle is removed from the polygon, and the area of the triangle is added to areap. The vertex verts[vert] is removed from the original polygon, leaving a new, smaller polygon. The area of this polygon is reduced by recursively calling poly_area_loc(). If the reduction is successful, the routine returns 0 and

areap contains the area of the original polygon. If the reduction is unsuccessful, 1 is returned.

The function call is poly_area_loc(verts, num_verts, areap). Table 2.19-81 describes the parameters used and functions called using this function.

Parameters				
Parameter	Туре	Where Typedef Declared		
verts	pointer to LongPt	Development:SIMNET:libmac: longpt.h		
num_verts	short	Standard C type.		
areap	pointer to double	Standard C type.

Table 2.19-81 poly_area_loc Information.

2.19.4.1.3 inside_poly

inside_poly determines whether a point lies inside or outside a polygon. *inptp* is the point being tested; *outpt* is a point known to be outside the polygon. The polygon is formed by the array of vertices coordinates *verts*, with the number of vertices equal to *num_verts*. The function call is inside_poly(inptp, outptp, verts, num_verts). Table 2.19-82 describes the parameters used and functions called using this function.

Parameters			
Parameter	Гуре	Where Typedef Declared	
inptp	pointer to LongPt	Development:SIMNET:libmac: longpt.h	
outptp	pointer to LongPt	Development:SIMNET:libmac: longpt.h

Table 2.19-82 inside_poly Information.

2.19.4.2 poly_area.h

Development:SIMNET:MCC:CEW:poly_area.h

This file contains definitions used within the file poly_area.c. AREA_TRIANGLE is defined to compute the area of a triangle. MAX_NUM_VERTS is defined as the maximum number of vertices in a polygon whose area is calculated by poly_area().

2.19.4.3 seg_intrsct.c

Development:SIMNET:MCC:CEW:seg_intrsct.c

This file contains a routine used to determine whether a line segment crosses or inappropriately touches (i.e. in the middle) any of an array of previous line segments. The routine works with points whose coordinates are long.

2.19.4.3.1 seg_intrsct

seg_intrsct computes information on the intersection of a line segment with an array of connected line segments. The parameter paramsp is a segintparams structure formed of the members described in Section 2.19.4.4. paramsp->pt0p to paramsp->pt1p with the connected line segments array paramsp->pt_arr[i] to paramsp->pt_arr[i+1], where i is equal to 0 to paramsp->num_pt_arr - 2. (i.e. the connected points from paramsp->pt_arr[0] to paramsp->pt_arr[num_pt_arr - 1]. The number of points, paramsp->num_pt_arr, must be greater than or equal to 2. For computing points of intersection, paramsp->size_out_ptsp should be at least 2, in case of segment overlap. The function call is seg_intrsct(paramsp). Table 2.19-83 describes the parameters used and functions called using this function.

Table 2.19-83 seg_intrsct Information.

2.19.4.3.2 check_x_ints

check_x_ints checks for an intersection of finite line segments. The two segments are defined by the input coordinates pt0p to pt1p and pt2p to pt3p. The slope of the pt0p to pt1p segment is slope (dy/dx), and is assumed to be between -1 and 1. A description code of the type of intersection between the segments is returned. outcode contains the list of the intersection codes for which all intersection points are to be reported; outp and outp2 are arrays of intersection points, coded by the type of intersection of the given point; numoutp is the number of coded_lpoints that are valid intersection points. The function call is $check_x_ints(pt0p, pt1p, slope, pt2p, pt3p, outcode, outp, outp2, numoutp). Table 2.19-84 describes the parameters used and functions called using this function.$

Parameters			
Parameter	Туре	Where Typedef Declared	
pt0p	pointer to Long_Point	Development:SIMNET:CEW: seg_intrsct.h	
pt1p	pointer to Long_Point	Development:SIMNET:CEW: seg_intrsct.h	
slope	double	Standard C type.	
pt2p	pointer to Long_Point	Development:SIMNET:CEW: seg_intrsct.h	
pt3p	pointer to Long_Point	Development:SIMNET:CEW: seg_intrsct.h	
outcode	short	Standard C type.	
outp	pointer to coded_lpoint	Development:SIMNET:CEW: seg_intrsct.h	
outp2	pointer to coded_lpoint	Development:SIMNET:CEW: seg_intrsct.h	
numoutp	pointer to short	Standard C type.	
	internal Variables		
Variable	Туре	Where Typedef Declared

Table 2.19-84 check x ints Information.

2.19.4.3.3 check_y_ints

check_y_ints checks for an intersection of finite line segments. The two segments are defined by the input parameters pt0p to pt1p and pt2p to pt3p. The slope of the pt0p to pt1p segment is slope (dx/dy), and is assumed to be between -1 and 1. A description code of the type of intersection between the segments is returned. outcode contains the list of the intersection codes for which all intersection points are to be reported; outp and outp2 are arrays of intersection points, coded by the type of intersection of the given point; numoutp is the number of coded_lpoints that are valid intersection points. The function call is check_y_ints(pt0p, pt1p, slope, pt2p, pt3p, outcode, outp, outp2, numoutp). Table 2.19-85 describes the parameters used and functions called using this function.

2.19.4.4 seg intrsct.h

Development:SIMNET:MCC:CEW:seg_intrsct.h

This file contains macros used in the file seg_intrsct.c. It also contains the definitions of the segment intersect codes. Structures are defined for the segparams type, the point type, the Long Point type, and the coded Ipoint type.

The segparams type structure is composed of the following members:

pt0p -- One point of the segment to be tested. -- The second point of the segment to be tested. ptlp -- The connected segments to be tested against. pt arr -- The number of points in the array pt arr. num pt arr -- The intersection codes on which seg_intrsct() should abort. abort code -- The intersection codes which seg_intrsct() should report. num code -- An array allocated by the caller and intialized to 0. On return code num arr it contains the number of intersections found with each code. For example, code num arr[MID CROSS] contains the number of MIS CROSS intersections found. -- The intersection codes for which all intersection points out_pt_code should be reported. -- The number of points in the *coded lipoint* array, allocated by size_out_ptsp the caller. -- The array of intersection points, coded by the type of out ptsp intersection of the given point. -- The number of coded 1points that are valid intersection num out pts points on return of seg_intrsct().

2.19.5 CEW Objects

2.19.5.1 CheckList.c

Development:SIMNET:MCC:CEW:CheckList.c

This file contains routines for setting up the CheckLists. CheckLists are windows containing lists of items with check boxes. An item in the list is selected by clicking in the check box.

2.19.5.1.1 CheckList::init

CheckList::init allocates and initalizes an instance of a CheckList object. window is the window in which the list appears; r is the rectangle containing the list's viewable content. The function call is CheckList::init(WindowPtr window, Rect r). Table 2.19-88 describes the parameters used and functions called using this function.

Parameters			
Parameter	Type	Where Typedef Declared	
window	WindowPtr	Development:THINK C: Mac #includes:WindowMgr.h	
r	Rect	Development:THINK C: Mac #includes:MacTypes.h	

Internal Variables

2.19.5.3.2 ComWindow::AddHotSpot

ComWindow::AddHotSpot adds a hot spot to the ComWindow. A hot spot is an area in the window which performs a function when the user clicks in it (e.g. the OK button). r is the outline of the hot spot area; func contains the functionality of the hot spot. The function call is ComWindow::AddHotSpot(Rect r, ProcPtr func). Table 2.19-96 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
r	Rect	Development:THINK C: Mac #includes:MacTypes.h
func	ProcPtr	Development:THINK C: Mac #includes:MacTypes.h
	Calls	
Function	Where Described	
SetRect	Standard Quickdraw functi	on for Macintosh.
	Called By	
Function	Where Described	
PrintWindow	See Section 2.19.3.6.1.	
SetupResWindow	See Section 2.19.3.8.2.	

Table 2.19-96 ComWindow::AddHotSpot Information.

2.19.5.3.3 ComWindow::initial

ComWindow::initial allocates and initializes an instance of a ComWindow object. *ID* specifies the ID number of the window; *func* specifies the window's update function. The function call is ComWindow::initial(short ID, ProcPtr func). Table 2.19-97 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
ID .	short	Standard C type.
func	ProcPtr	Development:THINK C: Mac #includes:MacTypes.h
	Return Values	
Return Value	Type	Meaning
this	pointer to ComWindow	A handle to this instance of the ComWindow object.
	Calls	
Function	Where Described	
Swindow::init	See Section 2.19.5.13.1.	
	Called By	
Function	Where Described	
main	See Section 2.19.2.1.1.	
SetupResWindow	See Section 2.19.3.8.2.	

Table 2.19-97 ComWindow::initial Information.

2.19.5.3.4 ComWindow::CheckHotSpot

ComWindow::CheckHotSpot checks to see if the mouse point is in a hot spot. pt is the mouse point. The function call is ComWindow::CheckHotSpot(Point pt). Table 2.19-98 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
pt	Point	Development:THINK C: Mac #includes:MacTypes.h
	Internal Var	lables
Variable	Туре	Where Typedef Declared
i	short	Standard C type.
	Return Va	lues
Return Value	Type	Meaning
-1	short	The mouse point is not in a hot spot.
i	short	The resource number of a hot spot.
	Calls	
Function	Where Describe	d
PtInRect	Standard Ouickdray	v function for Macintosh.

Called By		
Function Where Described		
MainEventLoop	See Section 2.19.2.1.2.	
OtherEventLoop	See Section 2.19.3.8.7.	

Table 2.19-98 ComWindow::CheckHotSpot Information.

2.19.5.4 ComWindows.h

Development:SIMNET:MCC:CEW:ComWindows.h

This file contains the definition of the HotSpot type structure and a declaration of the ComWindow class as a child of the Swindow class.

2.19.5.5 Dialog_Windows.c

Development:SIMNET:MCC:CEW:Dialog_Windows.c

This file contains implementation routines for Dialog Windows.

2.19.5.5.1 DialogWindow::init

DialogWindow::init ComWindow::initial allocates and initializes an instance of a DialogWindow object. *ID* specifies the ID number of the window; *func* specifies the window's check function; *hand* specifies the window's special handler function. The function call is DialogWindow::init(short ID, ProcPtr func, ProcPtr hand). Table 2.19-99 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
ID	short	Standard C type.
func	ProcPtr	Development:THINK C: Mac #includes:MacTypes.h
hand	ProcPtr	Development:THINK C: Mac #includes:MacTypes.h
	Return Values	
Return Value	Туре	Meaning
this	pointer to DialogWindow	A handle to this instance of the DialogWindow object.
	Calls	
Function	Where Described	
NewPtr	Standard Memory Manager	function for Macintosh.
GetNewDialog	Standard Dialog Manager fu	nction for Macintosh.
	Called By	
Function	Where Described	
MacInits	See Section 2.19.2.1.3.	

Table 2.19-99 DialogWindow::init Information.

2.19.5.5.2 DialogWindow::handler

DialogWindow::handler handles events in DialogWindow objects. The function call is DialogWindow::handler(). Table 2.19-100 describes the internal variables used and functions called using this function.

Internal Variables		
Variable	Туре	Where Typedef Declared
itemhit	short	Standard C type.
done	short	Standard C type.
lastitem	short	Standard C type.
aevent	EventRecord	Development:THINK C
		Mac #includes:EventMgr.h
C	char	Standard C type.
type	short	Standard C type.
ltype	short	Standard C type.
h_item	Handle	Development:THINK C:
		Mac #includes:MacTypes.h
lh_item	Handle	Development:THINK C:
		Mac #includes:MacTypes.h
box	Rect	Development:THINK C:
		Mac #includes:MacTypes.h
lbox	Rect	Development:THINK C:
		Mac #includes:MacTypes.h
reset	Boolean	Development:THINK C:
		Mac #includes:MacTypes.h
special	short	Standard C type.
	Return Values	
Return Value	Туре	Meaning
special	short	A special handler function
		exists for this DialogWindow
itemhit	short	The resource id of the item
		which was hit.
	Calls	
Function	Where Described	
SysBeep	Standard Operating Sys	tem Utility function for Macintosh.
SystemTask	Standard Desk Manager	function for Macintosh.
GetNextEvent	Standard Toolbox Event	Manager function for Macintosh
SpecialHandlerFunc		
CheckFunc		
IsDialogEvent	Standard Dialog Manage	er function for Macintosh.
DialogSelect		er function for Macintosh.
GetDltem		er function for Macintosh.
	Called By	
Function	Where Described	
activate	See Section 2.19.5.5.3	
donvate	Oee Geolion 2.13.3.3.3.	

Table 2.19-100 DialogWindow::handler Information.

2.19.5.5.3 DialogWindow::activate

DialogWindow::activate brings the DialogWindow to the front, and makes it visible and usable. The function call is DialogWindow::activate(). Table 2.19-101 describes the internal variables used and functions called using this function.

Internal Variables		
Variable	Туре	Where Typedef Declared
lastButton	short	Standard C type.
	Return Valu	es
Return Value	Туре	Meaning
lastButton	short	3,55
	Calls	
Function	Where Described	
ShowWindow	Standard Window Ma	nager function for Macintosh.
HiliteWindow	Standard Window Manager function for Macintosh.	
SelectWindow	Standard Window Manager function for Macintosh.	
SetPort	Standard Quickdraw	function for Macintosh.
DialogOutlineItem	See Section 2.19.5.	5.19.
handler	See Section 2.19.5.	5.2.
close	See Section 2.19.5.5	5.6.
	Called By	
Function	Where Described	
ReviewSelection	See Section 2.19.3.	2.15.
MissionSelection	See Section 2.19.3.	
MissionObj::edit	See Section 2.19.5.7	7.2.
MissionObj::show	See Section 2.19.5.7	7.4.

Table 2.19-101 DialogWindow::activate Information.

2.19.5.5.4 DialogWindow::quit

DialogWindow::quit closes the dialog, cleaning up its memory allocations. The function call is DialogWindow::quit(). Table 2.19-102 describes the functions called using this function.

Calls	
Function	Where Described
CloseDialog	Standard Dialog Manager function for Macintosh.
DisposHandle	Standard Memory Manager function for Macintosh.
DisposPtr	Standard Memory Manager function for Macintosh.
	Called By
Function	Where Described
DeleteResourceLists	See Section 2.19.3.7.3.

Table 2.19-102 DialogWindow::quit Information.

2.19.5.5.6 DialogWindow::close

DialogWindow::close makes the DialogWindow not visible. The function call is DialogWindow::close(). Table 2.19-104 describes the functions called using this function.

Calls	
Function	Where Described
HideWindow	Standard Window Manager function for Macintosh.
	Called By
Function	Where Described
activate	See Section 2.19.5.5.3.

Table 2.19-104 DialogWindow::close Information.

2.19.5.5.7 DialogWindow::GetText

DialogWindow::GetText fills in the text string pointer, text, with the text value of item. The function call is DialogWindow::GetText(short item, char text). Table 2.19-105 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
item	short	Standard C type.	
text	pointer to char	Standard C type.	
	Internal Variabl	es	
Variable	Туре	Where Typedef Declared	
type	short	Standard C type.	
h_item	Handle	Development:THINK C: Mac #includes:MacTypes.h	
box	Rect	Development:THINK C: Mac #includes:MacTypes.h	
	Calls		
Function	Where Described		
GetDitem	Standard Dialog Manag	Standard Dialog Manager function for Macintosh.	
GetIText	Standard Dialog Manag	er function for Macintosh.	
	Called By		
Function	Where Described		
isLegalMinefield	See Section 2.19.3.2.2.		
setEmplacementTime	See Section 2.19.3.2.4.		
CheckEmplacementDialog	See Section 2.19.3.2.5.		
setBreachTime	See Section 2.19.3.2.6.		
CheckBreachDialog	See Section 2.19.3.2.7	7.	
CheckMoveDialog	See Section 2.19.3.2.8	3.	
DetermineMines	See Section 2.19.3.2.1	14.	
MissionObj::edit	See Section 2 19.5.7 2	2	

Table 2.19-105 DialogWindow::GetText Information.

2.19.5.5.8 DialogWindow::SetText

DialogWindow::SetText sets the text value of *item* to the text string passed in *text*. The function call is DialogWindow::SetText(short item, char text). Table 2.19-106 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
item	short	Standard C type.	
text	pointer to char	Standard C type.	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
type	short	Standard C type.	
h_item	Handle	Development:THINK C: Mac #includes:MacTypes.h	
box	Rect	Development:THINK C: Mac #includes:MacTypes.h	
	Calls		
Function	Where Described	Where Described	
GetDItem	Standard Dialog Manager 1	Standard Dialog Manager function for Macintosh.	
SetiText	Standard Dialog Manager t	Standard Dialog Manager function for Macintosh.	
	Called By		
Function	Where Described		
setEmplacementTime	See Section 2.19.3.2.4.		
CheckEmplacementDialog	See Section 2.19.3.2.5.		
setBreachTime	See Section 2.19.3.2.6.		
CheckBreachDialog	See Section 2.19.3.2.7.		
CheckMoveDialog	See Section 2.19.3.2.8.		
DetermineMines	See Section 2.19.3.2.14.		
MissionObj::edit	See Section 2.19.5.7.2.		
MissionObj::show	See Section 2.19.5.7.4.		

Table 2.19-106 DialogWindow::SetText Information.

2.19.5.5.9 DialogWindow::SelectText

DialogWindow::SelectText highlights the text in the given *item*. The function call is DialogWindow::SelectText(short item). Table 2.19-107 describes the parameters used and functions called using this function.

	Paramete	ers
Parameter	Туре	Where Typedef Declared
item	short	Standard C type.
	Calls	
Function	Where Describe	d
SellText	Standard Dialog Manager function for Macintosh.	

Called By		
Function Where Described		
CheckEmplacementDialog	See Section 2.19.3.2.5.	
MissionObj::edit	See Section 2.19.5.7.2.	

Table 2.19-107 DialogWindow::SelectText Information.

2.19.5.5.10 DialogWindow::GetValue

DialogWindow::GetValue returns the control value of the given *item*. The function call is DialogWindow::GetValue(short item). Table 2.19-108 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
item	short	Standard C type.	
			
	Internal Variables		
Variable	Туре	Where Typedef Declared	
type	short	Standard C type.	
h_item	Handle	Development:THINK C:	
		Mac #includes:MacTypes.h	
box	Rect	Development:THINK C:	
		Mac #includes:MacTypes.h	
	Return Values		
Return Value	Type	Meaning	
GetCtlValue((ControlHandle)	short	The control value of the	
h_item)	<u> </u>	specified item.	
	Calls		
Function	Where Described		
GetDitem	Standard Dialog Manager ful	nction for Macintosh.	
GetCtlValue			
	Called By		
Function	Where Described		
CheckEmplacementDialog	See Section 2.19.3.2.5.		
DetermineMines	See Section 2.19.3.2.14.		
ReviewSelection	See Section 2.19.3.2.15.		
MissionObj::edit	See Section 2.19.5.7.2.		

Table 2.19-108 DialogWindow::GetValue Information.

2.19.5.5.11 DialogWindow::SetValue

DialogWindow::SetValue sets the control value of the specified item. *item* is the DialogWindow item; *value* is the control value to set. The function call is DialogWindow::SetValue(short item, short value). Table 2.19-109 describes the parameters used and functions called using this function.

Parameters					
Parameter	Туре	Where Typedef Declared			
item	short	Standard C type.			
value	short	Standard C type.			
	internal Variables				
Variable	Туре	Where Typedef Declared			
type	short	Standard C type.			
h_item	Handle	Development:THINK C:			
		Mac #includes:MacTypes.h			
box	Rect	Development:THINK C:			
		Mac #includes:MacTypes.h			
	Calls				
Function	Where Described				
GetDitem	Standard Dialog Manager fund	ction for Macintosh.			
SetCtlValue	Standard Control Manager fur	nction for Macintosh.			
	Called By				
Function	Where Described				
CheckEmplacementDialog	See Section 2.19.3.2.5.				
CheckBreachDialog	See Section 2.19.3.2.7.				
CheckReviewDialog	See Section 2.19.3.2.13.				
ReviewSelection	See Section 2.19.3.2.15.				
MissionObj::edit	See Section 2.19.5.7.2.				
MissionObj::show_	See Section 2.19.5.7.4.				

Table 2.19-109 DialogWindow::SetValue Information.

2.19.5.5.12 DialogWindow::HiliteItem

DialogWindow::HiliteItem highlights the value of the item. item is the DialogWindow item; value is the control value of item. The function call is DialogWindow::HiliteItem(short item, short value). Table 2.19-110 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
item	short	Standard C type.
value	short	Standard C type.
	Internal Vari	ables
Variable	Type	Where Typedef Declared
type	short	Standard C type.
vai	short	Standard C type.
h_item	Handle	Development:THINK C:
		Mac #includes:MacTypes.h
box	Rect	Development:THINK C:
		Mac #includes:MacTypes.h

Calls		
Function Where Described		
GetDitem	Standard Dialog Manager function for Macintosh.	
HiliteControl	Standard Control Manager function for Macintosh.	
	Called By	
Function	Called By Where Described	
Function ReviewSelection	Called By Where Described See Section 2.19.3.2.15.	

Table 2.19-110 DialogWindow::HiliteItem Information.

2.19.5.5.13 DialogWindow::SetUserItem

DialogWindow::SetUserItem sets the DialogWindow's user item to the specified handler routine. This user specified handler routine will be used to handle events while the dialog is active. *item* is the user item; *routine* is the handler routine. The function call is DialogWindow::SetUserItem(short item, ProcPtr routine). Table 2.19-111 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
item	short	Standard C type.
routine	ProcPtr	Development:THINK C:
		Mac #includes:MacTypes.h
	Internal Varia	phloe
Variable	Type	Where Typedef Declared
type	short	Standard C type.
h item	Handle	Development:THINK C:
II_Rem	lianole	Mac #includes:MacTypes.h
box	Rect	Development:THINK C:
		Mac #includes:MacTypes.h
	Calls	
Function	Where Described	1
GetDltem	Standard Dialog Manager function for Macintosh.	
SetDItem		nager function for Macintosh.
	Called By	/
Function	Where Described	
MacInits	See Section 2.19.2	.1.3.

Table 2.19-111 DialogWindow::SetUserItem Information.

2.19.5.5.14 DialogWindow::GetItemRect

DialogWindow::GetItemRect returns the box that describes the specified item. The function call is DialogWindow::GetItemRect(short item). Table 2.19-112 describes the parameters used and functions called using this function.

	Paramete	rs
Parameter	Туре	Where Typedef Declared
item	short	Standard C type.
	internal Vari	
Variable	Type	Where Typedef Declared
type	short	Standard C type.
h_item	Handle	Development:THINK C:
		Mac #includes:MacTypes.h
box	Rect	Development:THINK C:
		Mac #includes:MacTypes.h
	Return Val	ues
Return Value	Туре	Meaning
box	Rect	The box that describes the
		item.
	Calls	
Function	Where Described	
GetDitem	Standard Dialog Ma	nager function for Macintosh.
	Called B	v
Function	Where Describe	
ResourceItems	See Section 2.19.3.7.1.	

Table 2.19-112 DialogWindow::GetItemRect Information.

2.19.5.5.15 DialogWindow::equal

DialogWindow::equal determines if *other* is the same dialog as this object instance. The function call is DialogWindow::equal(WindowPtr other). Table 2.19-113 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
other	WindowPtr	Development:THINK C: Mac #includes:WindowMgr.h
	Return Values	
Return Value	Туре	Meaning
other == dialog	Boolean	TRUE if other is the same dialog; FALSE if other is not the same dialog.
	Called By	
Function	Where Described	
ResourceItems	See Section 2.19.3.7.1.	

Table 2.19-113 DialogWindow::equal Information.

2.19.5.5.16 DialogWindow::GetDialogPtr

DialogWindow::GetDialogPtr returns the dialog pointer of this DialogWindow object. The function call is DialogWindow::GetDialogPtr(). Table 2.19-114 describes the values returned by this function.

	Return Values	
Return Value	Type	Meaning
dialog	DialogPtr	The dialog pointer of this DialogWindow object.
	Called By	
Function	Where Described	
CheckEmplacementDialog	See Section 2.19.3.2.5.	
CheckBreachDialog	See Section 2.19.3.2.7.	
CheckMoveDialog	See Section 2.19.3.2.8.	

Table 2.19-114 DialogWindow::GetDialogPtr Information.

2.19.5.5.17 DialogWindow::BringToFront

DialogWindow::BringToFront brings this DialogWindow to the front of the screen. The function call is DialogWindow::BringToFront(). Table 2.19-115 describes the functions called using this function.

Calls	
Function	Where Described
HiliteWindow	Standard Window Manager function for Macintosh.
SelectWindow	Standard Window Manager function for Macintosh.
SetPort	Standard Quickdraw function for Macintosh.

Table 2.19-115 DialogWindow::BringToFront Information.

2.19.5.5.18 DialogOutlineItem

DialogOutlineItem highlights the specified item in the specified dialog. dialog is the specified DialogWindow; itemNo is the item to highlight. The function call is DialogOutlineItem(dialog, itemNo). Table 2.19-116 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
dialog	register DialogPtr	Development:THINK C: Mac #includes:DialogMgr.h
itemNo	short	Standard C type.

	Internal Variables	
Variable	Туре	Where Typedef Declared
i	short	Standard C type.
theitem	Handle	Development:THINK C: Mac #includes:MacTypes.h
r	Rect	Development:THINK G: Mac #includes:MacTypes.h
СР	register pointer to char	Standard C type.
Function	Where Described	
	Calls	
GetDitem	Standard Dialog Manager for	Inction for Macintosh
InsetRect	Standard Quickdraw function	
GetHandleSize	Standard Memory Manager	
SetHandleSize	Standard Memory Manager	
MemError	Standard Memory Manager	
	Called By	
Function	Where Described	
DialogWindow::activate	See Section 2.19.5.5.3.	

Table 2.19-116 DialogOutlineItem Information.

2.19.5.6 Dialog_Windows.h Development:SIMNET:MCC:CEW:Dialog_Windows.h

This file contains the declaration of the DialogWindows class.

2.19.5.7 MissionObj.c
Development:SIMNET:MCC:CEW:MissionObj.c

This file implements the MissionObj objects.

	Variables	
Variable	Туре	Where Typedef Declared
emplace_dlog	extern pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h
breach_dlog	extern pointer to DialogWindow	Development:SIMNET:CEW: Dialog Windows.h
move_dlog	extern pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h
stat_emplace	extern pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h
stat_breach	extern pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h
stat_move	extern pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h
missionList	extern pointer to TextList	Development:SIMNET:CEW: TextList.h
breach_availList	pointer to CheckList	Development:SIMNET:CEW: CheckList.h
move_availList	pointer to CheckList	Development:SIMNET:CEW: CheckList.h
emplace_availList	pointer to CheckList	Development:SIMNET:CEW: CheckList.h
stat_emplace_availList	pointer to CheckList	Development:SIMNET:CEW: CheckList.h
stat_move_availList	pointer to CheckList	Development:SIMNET:CEW: CheckList.h
stat_breach_availList	pointer to CheckList	Development:SIMNET:CEW: CheckList.h
totalResources	extern short	Standard C type.
serviceq	extern pointer to ServiceObj	Development:SIMNET:CEW: ServiceObj.h
cewResources	extern pointer to array of ResourceObj	Development:SIMNET:CEW: ResourceObj.h
str_mission	pointer to array of char	Standard C type.

Table 2.19-117 MissionObj.c Variable Information.

2.19.5.7.1 MissionObj::init

MissionObj::init initializes and allocates an instance of the MissionObj Object. *ID* is an index into the Mission List. The function call is MissionObj::init(short ID). Table 2.19-118 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
ID	short	Standard C type.
	Return Values	
Return Value	Type	Meaning
this	pointer to MissionObj	A handle to this instance of the MissionObj Object.

	Called By
Function	Where Described
MissionSelection	See Section 2.19.3.5.3.

Table 2.19-118 MissionObj::init Information.

2.19.5.7.2 MissionObj::edit

MissionObj::edit fills in the correct fields when the user edits a mission. The mission number, the start and finish times, the depth of the minefield, and the number of mines required are filled in. edit_reason is the reason for the edit (either because a new mission is being created, the user requested an edit through the Review dialog, or an asset was destroyed). The function call is MissionObj::edit(edit_reason). Table 2.19-119 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
edit_reason_	short	Standard C type.
	Internal Variable	S
Variable	Туре	Where Typedef Declared
tempStr	Str255	Development:THINK C: Mac #includes:MacTypes.h
aStr	Str255	Development:THINK C: Mac #includes:MacTypes.h
bStr	Str255	Development:THINK C: Mac #includes:MacTypes.h
tempLong	long	Standard C type.
tempint	short	Standard C type.
lastButton	short	Standard C type.
i	short	Standard C type.
mf_pts	short	Standard C type.
the_dlog	register pointer to DialogWindow	Development:SIMNET:CEW: Dialog_Windows.h
currentTime	DateTimeGroup	Development:SIMNET:libmac: dtg.h
time_diff	long	Standard C type.
	Return Values	
Return Value	Туре	Meaning
FALSE	short	The mission was aborted.
TRUE	short	The mission is pending.

Calls	
Function	Where Described
NumToString	Standard Binary to Decimal Conversion Package function for Macintosh.
DialogWindow::SetText	See Section 2.19.5.5.8.
DialogWindow::SetValue	See Section 2.19.5.5.11.
DTGToString	See Section 2.22.1.15.1.
CheckList::SetState	See Section 2.19.5.1.5.
DialogWindow::SelectText	See Section 2.19.5.5.9.
DialogWindow::GetText	See Section 2.19.5.5.7.
DialogWindow::GetValue	See Section 2.19.5.5.10.
CheckList::GetState	See Section 2.19.5.1.6.
DialogWindow::activate	See Section 2.19.5.5.3.
StringToDTG	See Section 2.22.1.15.2.
Get_DTG	See Section 2.22.1.15.4.
DTGElapsed	See Section 2.22.1.15.3.
CEDTGToString	See Section 2.19.3.10.8.
AssembleMissionString	See Section 2.19.3.9.1.
TextList::SetRow	See Section 2.19.5.15.9.
SetStatus	See Section 2.19.5.7.20.
	Called_By
Function	Where Described
ReviewSelection	See Section 2.19.3.2.15.
NewMission	See Section 2.19.5.7.3.
ServiceObj::CheckQs	See Section 2.19.5.11.4.

Table 2.19-119 MissionObj::edit Information.

2.19.5.7.3 MissionObj::NewMission

When the user selects the New Mission button and fills in the proper fields, MissionObj::NewMission sets up a new mission and adds it to the appropriate mission list for the *missionType* (either Emplacement, Breach, or Move). The mission number, the start and finish times, the depth of the minefield, and the number of mines required are filled in. The function call is MissionObj::NewMission(short missionType). Table 2.19-120 describes the parameters used and functions called using this function.

Parameter	Type	Where Typedef Declared
missionType	short	Standard C type.

	Internal Variables	
Variable	Туре	Where Typedef Declared
tempStr	Str255	Development:THINK C:
		Mac #includes:MacTypes.h
aStr	Str255	Development:THINK C:
	<u> </u>	Mac #includes:MacTypes.h
bStr	Str255	Development:THINK C:
		Mac #includes:MacTypes.h
the_list	pointer to CheckList	Development:SIMNET:CEW:
		CheckList.h
currentTime	DateTimeGroup	Development:SIMNET:libmac:
		dtg.h
<u>i </u>	short	Standard C type.
	Return Values	
Return_Value		Meaning
FALSE	short	The mission was not created.
TRUE	short	The mission was created.
	0-110	
Function	Calls	
Function	Where Described	
Get_DTG	See Section 2.22.1.15.4.	_

ResetMissionTime	See Section 2.19.5.7.17.	

Table 2.19-127 MissionObj::SetStartActivityTime Information.

2.19.5.7.11 MissionObj::SetEndTime

MissionObj::SetEndTime sets the end time of a mission. *new_time* is the new mission end time. The function call is MissionObj::SetEndTime(new_time). Table 2.19-128 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
new_time	unsigned long	Standard C type.
	Calls	
Function	Where Described	
DTGElapsed	See Section 2.22.1.15.3.	
	Called By	
Function	Where Described	
ReviewSelection	See Section 2.19.3.2.15.	
ResetMissionTime	See Section 2.19.5.7.17.	

Table 2.19-128 MissionObj::SetEndTime Information.

2.19.5.7.12 MissionObj::GetNumber

MissionObj::GetNumber returns the index into the mission list for this mission. The function call is MissionObj::GetNumber(). Table 2.19-129 describes the values returned by this function.

Return Values		
Return Value	Type	Meaning
number	short	The index into the mission list.
	Called By	
Function	Where Described	
ServiceObj::CheckQs	See Section 2.19.5.11.4.	

Table 2.19-129 MissionObj::GetNumber Information.

2.19.5.7.13 MissionObj::SetResStatus

MissionObj::SetResStatus sets the status of each resource assigned to this mission. *state* is the status to set. The function call is MissionObj::SetResStatus(state). Table 2.19-130 describes the parameters used and functions called using this function.

Parameters				
Parameter	Туре	Where Typedef Declared		
state	short	Standard C type.		
	Internal Variables			
Variable	Type	Where Typedef Declared		
i	short	Standard C type.		
	Return Values			
Return Value	Туре	Meaning		
TRUE	short	Successful.		
	Calls			
Function	Where Described

SendStartMovement	See Section 2.19.5.7.24.	

Table 2.19-131 MissionObj::UpdateResAssigned Information.

2.19.5.7.15 MissionObj::CheckResStatus

MissionObj::CheckResStatus checks the status of each resource assigned to this mission. The function call is MissionObj::CheckResStatus(). Table 2.19-132 describes the internal variables used and functions called using this function.

	Internal Variables	
Variable	Type	Where Typedef Declared
i	short	Standard C type.
	Return Values	
Return Value	Type	Meaning
FALSE	short	One or more of the resources are not ready.
TRUE	short	All resources are ready.
· · · · · · · · · · · · · · · · · · ·	Calls	
Function	Where Described	
ResourceObj::GetStatus	See Section 2.19.5.9.12.	
	Called By	
Function	Where Described	
ServiceObj::CheckQs	See Section 2.19.5.11.4.	

Table 2.19-132 MissionObj::CheckResStatus Information.

2.19.5.7.16 MissionObj::UpdateResPosition

MissionObj::UpdateResPosition updates the position of each resource assigned to this mission. The function call is MissionObj::UpdateResPosition(). Table 2.19-133 describes the internal variables used and functions called using this function.

	Internal Variables	
Variable	Туре	Where Typedef Declared
i	short	Standard C type.
mp	MapCoordinates	Development:SIMNET:libmac: map.h
	Calls	· · · · · · · · · · · · · · · · · · ·
Function	Where Described	
StringToMapCoordinates	See Section 2.22.1.26.1.	
ResourceObj::SetPosition	See Section 2.19.5.9.4.	
	Called By

Table 2.19-137 MissionObj::SetStatus Information.

2.19.5.7.21 MissionObj::GetStatus

MissionObj::GetStatus returns the status code for this mission. The function call is MissionObj::GetStatus(). Table 2.19-138 describes the values returned by this function.

	Return Values	
Return Value	Туре	Meaning
status	short	This mission's status.
	Called By	
Function	Where Described	
ProcessRequest	See Section 2.19.2.1.5.	
ReviewSelection	See Section 2.19.3.2.15.	
UpdateMissionString	See Section 2.19.5.7.5.	
ResetMissionTime	See Section 2.19.5.7.17.	
ServiceObj::CheckQs	See Section 2.19.5.11.4.	

Table 2.19-138 MissionObj::GetStatus Information.

2.19.5.7.22 MissionObj::GetType

MissionObj::GetType returns the type of this mission. Mission types can be either Emplacement, Breach, or Move. The function call is MissionObj::GetType(). Table 2.19-139 describes the values returned by this function.

Return Values		
Return Value	Type	Meaning
type	short	This mission's type.

Table 2.19-139 MissionObj::GetType Information.

2.19.5.7.23 MissionObj::GetOrderType

MissionObj::GetOrderType returns the order type of this mission. Missions can either be Warned or Execute. The function call is MissionObj::GetOrderType(). Table 2.19-140 describes the values returned by this function.

	Return Values	
Return Value	Туре	Meaning
order_type	short	This mission's order type.
		2222

Table 2.19-147 MissionObj::SendArrival Information.

2.19.5.8 MissionObj.h

Development:SIMNET:MCC:CEW:MissionObj.h

This file contains definitions of mission and order types, and edit and show reasons. It also contains the type definition of MinefieldType, and the declaration of the MissionObj class.

2.19.5.9 ResourceObj.c

Development:SIMNET:MCC:CEW:ResourceObj.c

This file implements the ResourceObj objects.

Variables		
Variable	Type	Where Typedef Declared
str_re]	pointer to array of char	Standard C type.

Table 2.19-148 ResourceObj.c Variable Information.

2.19.5.9.1 ResourceObj::init

ResourceObj::init initializes this resource object. The resource is given its initial attributes as follows: akind is the kind of resource; a_name is the name of the resource, speed is the maximum speed of the resource; ccv is the host value stored as the ccv number. The function call is ResourceObj::init(akind, a_name, speed, ccv). Table 2.19-149 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
akind	long	Standard C type.
a_name	Ptr	Development:THINK C:
		Mac #includes:MacTypes.h
speed	short	Standard C type.
ccv	long	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
temp	array of 255 char	Standard C type.
	Return Values	
Return Value	Type	Meaning
this	pointer to ResourceObj	A handle to this instance of the ResourceObj object.
	Calls	
Function	Where Described	
stpcpy	See Section 2.19.3.10.3.	
	Called By	· · · · · · · · · · · · · · · · · · ·
Function	Where Described	
ProcessRequest	See Section 2.19.2.1.5.	
LoadCannedResources	See Section 2.19.3.1.2.	

Table 2.19-149 ResourceObj::init Information.

2.19.5.9.2 ResourceObj::GetKind

ResourceObj::GetKind returns the kind of this resource. The function call is ResourceObj::GetKind(). Table 2.19-150 describes the values returned by this function.

	Return Values	
Return Value	Туре	Meaning
kind	long	This resource's kind.
	Called By	
Function	Where Described	
setEmplacementTime	See Section 2.19.3.2.4.	
CheckEmplacementDialog	See Section 2.19.3.2.5.	
setBreachTime	See Section 2.19.3.2.6.	
CheckBreachDialog	See Section 2.19.3.2.7.	
MissionObj::ResetMission Time	See Section 2.19.5.7.17.	

Table 2.19-150 ResourceObj::GetKind Information.

2.19.5.9.3 ResourceObj::GetCCVNumber

ResourceObj::GetCCVNumber returns the ccv number of this resource. The function call is ResourceObj::GetCCVNumber(). Table 2.19-151 describes the values returned by this function.

Return Values		
Return Value	Type	Meaning
ccv_number	long	This resource's ccv number.
	Called By	
Function	Where Described	
ProcessRequest	See Section 2.19.2.1.5.	
MissionObj::SendDispatch	See Section 2.19.5.7.29.	
MissionObj::SendArrival	See Section 2.19.5.7.30.	

Table 2.19-151 ResourceObj::GetCCVNumber Information.

2.19.5.9.4 ResourceObj::SetPosition

ResourceObj::SetPosition sets the position of this resource. *location* is the (x,y) coordinate of the position. The routine checks the validity of the passed location. The function call is ResourceObj::SetPosition(location). Table 2.19-152 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
location	LongPt	Development.SIMNET:libmac: longpt.h
	Internal Variables	
Variable	Type	Where Typedef Declared
err9	short	Standard C type.
tempstr	Str255	Development:THINK C: Mac #includes:MacTypes.h
Error Name	Errors Reason for Error	
badMapStringErr	???	
badMapLettersErr	7??	
outOfGridZoneErr	???	
noGridZoneErr	???	
	Calls	
Function	Where Described	
PointToMapCoordinates	See Section 2.22.1.26.2.	
Notify	See Section 2.19.3.4.4.	

Called By		
Function Where Described		
ProcessRequest	See Section 2.19.2.1.5.	
LoadCannedResources	See Section 2.19.3.1.2.	
MissionObj::UpdateRes Position	See Section 2.19.5.7.16.	

Table 2.19-152 ResourceObj::SetPosition Information.

2.19.5.9.5 ResourceObj::GetMission

ResourceObj::GetMission returns the mission assignment for this resource. The function call is ResourceObj::GetMission(). Table 2.19-153 describes the values returned by this function.

Return Values		
Return Value	Type	Meaning
missionAssigned	short	The mission assignment of this resource.
-		
	Called By	
Function	Called By Where Described	
Function ProcessRequest		

Table 2.19-153 ResourceObj::GetMission Information.

2.19.5.9.6 ResourceObj::SetMission

ResourceObj::SetMission assigns this resource to the mission specified by m. The function call is ResourceObj::SetMission(m). Table 2.19-154 describes the parameters used by this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
m	short	Standard C type.	
	Called By		
Function	Where Described		
MissionObj::UpdateRes Assigned	See Section 2.19.5.7.14		

Table 2.19-154 ResourceObj::SetMission Information.

2.19.5.9.7 ResourceObj::GetPosition

ResourceObj::GetPosition fills in the parameter pos with the (x,y) coordinates of this resource's position. The function call is ResourceObj::GetPosition(pos). Table 2.19-155 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
pos	pointer to LongPt	Development:SIMNET:libmac: longpt.h
	Called By	
Function	Where Described	
MissionObj::SendArrival	See Section 2.19.5.7.30.	

Table 2.19-155 ResourceObj::GetPosition Information.

2.19.5.9.8 ResourceObj::GetKph

ResourceObj::GetKph returns the travel speed of this resource (in km/hr). The function call is ResourceObj::GetKph(). Table 2.19-156 describes the values returned by this function.

Return Values		
Return Value	Туре	Meaning
km_per_hr	short	The speed of this resource.

Table 2.19-156 ResourceObj::GetKph Information.

2.19.5.9.9 ResourceObj::DistanceToSecs

ResourceObj::DistanceToSecs calculates the length of time it will take this resource to travel to the passed UTM location, *location*. The function call is

ResourceObj::DistanceToSecs(location). Table 2.19-157 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
location	UTMCoordinates	Development:SIMNET:CEW: SimnetTypes.h
	Internal Variable	<u> </u>
Variable	Туре	Where Typedef Declared
start_pt	LongPt	Development:SIMNET:libmac longpt.h
end_pt	LongPt	Development:SIMNET:libmac longpt.h
meters_per_second	float	Standard C type.
dis	long	Standard C type
	Return Values	
Return Value	Type	Meaning
0L	unsigned long	The resource's current position is <i>location</i> .
dis	unsigned long	The time it will take this resource to travel to location.

Calls		
Function	Where Described	
UTMToLongPt	See Section 2.19.3.3.5.	
DistBetween2Pts	See Section 2.22.1.23.2.	
	Called By	
Function	Where Described	
setBreachTime	See Section 2.19.3.2.6.	
CheckMoveDialog	See Section 2.19.3.2.8.	
MissionObj::ResetMission Time	See Section 2.19.5.7.17.	

Table 2.19-157 ResourceObj::DistanceToSecs Information.

2.19.5.9.10 ResourceObj::GetName

ResourceObj::GetName fills in a_name with the vehicle name of this resource. The function call is ResourceObj::GetName(a_name). Table 2.19-158 describes the parameters used and functions called using this function.

Parameters			
Parameter	Type	Where Typedef Declared	
a_name	Ptr	Development:THINK C: Mac #includes:MacTypes.h	
	Calls		
Function	Where Described		
stpcpy	See Section 2.19.3.10.3.		
	Called By		
Function	Where Described		
ProcessRequest	See Section 2.19.2.1.5.		
Resourcelterns	See Section 2.19.3.7.1.		

Table 2.19-158 ResourceObj::GetName Information.

2.19.5.9.11 ResourceObj::SetStatus

ResourceObj::SetStatus sets this resource's status to *stat*. The function call is ResourceObj::SetStatus(stat). Table 2.19-159 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
stat	short	Standard C type.
	Called By	
Function	Where Described	
ProcessRequest	See Section 2.19.2.1.5.	
LoadCannedResources	See Section 2.19.3.1.2.	
MissionObj::SetResStatus	See Section 2.19.5.7.13.	

Table 2.19-159 ResourceObj::SetStatus Information.

2.19.5.9.12 ResourceObj::GetStatus

ResourceObj::GetStatus returns the status of this resource. The function call is

ResourceObj::GetStatus(). Table 2.19-160 describes the values returned by this function.

Return Values			
Return Value	Туре	Meaning	
status	short	The status of this resource.	
	Called By		
Function	Where Described		
SetupResWindow	See Section 2.19.3.8.2.		
MissionObj::CheckResStatus	See Section 2.19.5.7.15.		
MissionObj::ResetMission Time	See Section 2.19.5.7.17.		

Table 2.19-160 ResourceObj::GetStatus Information.

2.19.5.9.13 ResourceObj::show

ResourceObj::show fills in the parameter string with relevent information about the position, status, and speed of this resource. The function call is ResourceObj::show(string). Table 2.19-161 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
string	pointer to char	Standard C type.
	Internal Variabl	es
Variable	Type	Where Typedef Declared
tempStr	Str255	Development:THINK C: Mac #includes:MacTypes.h
	Calls	
Function	Where Described	
NumToString	Standard Binary to Dec Macintosh.	imal Conversion Package function for
AssembleResourceString	See Section 2.19.3.9.2	2.
	Called By	
Function	Where Described	
SetupResWindow	See Section 2.19.3.8.2	2.

Table 2.19-161 ResourceObj::show Information.

2.19.5.10 ResourceObj.h

Development:SIMNET:MCC:CEW:ResourceObj.h

This file declares the ResourceObj object class.

2.19.5.11 ServiceObj.c

Development:SIMNET:MCC:CEW:ServiceObj.c

This file implements the ServiceObj objects.

2.19.5.11.1 ServiceObj::init

ServiceObj::init initializes and allocates an instance of a ServiceObj object. The ServiceObj object contains the queue of events. The function call is ServiceObj::init(). Table 2.19-162 describes the values returned by this function.

Return Values		
Return Value	Type	Meaning
this	pointer to ServiceObj	A handle to the ServiceObj object created.
	Called By	
Function	Where Described	
MacInits	See Section 2.19.2.1.3.	

Table 2.19-162 ServiceObj::init Information.

2.19.5.11.2 ServiceObj::AddService

ServiceObj::AddService adds an event, a_mission, to the end of the ServiceList queue. The function call is ServiceObj::AddService(a_mission). Table 2.19-163 describes the parameters used and functions called using this function.

Parameters				
Parameter	Туре	Where Typedef Declared		
a_mission	pointer to MissionObj	Development:SIMNET:CEW: MissionObj.h		
Internal Variables				
Variable	Type	Where Typedef Declared		
p	ServicePtr	Development:SIMNET:CEW: ServiceObj.h		
q	ServicePtr	Development:SIMNET:CEW: ServiceObj.h		
	Calls			
Function		Where Described		
NewPtr	Standard Memory Manager function for Macintosh.			
CheckQs	See Section 2.19.5.11.4.	See Section 2.19.5.11.4.		
Called By				
Function	Where Described			
MissionObj::NewMission	See Section 2.19.5.7.3.			

Table 2.19-163 ServiceObj::AddService Information.

2.19.5.11.3 ServiceObj::DeleteService

ServiceObj::DeleteService removes an event, x, from the ServiceList queue. The function call is ServiceObj::DeleteService(x). Table 2.19-164 describes the parameters used and functions called using this function.

Parameters				
Parameter	Туре	Where Typedef Declared		
X	pointer to MissionObj	Development:SIMNET:CEW: MissionObj.h		
	Internal Variables			
Variable	Type	Where Typedef Declared		
р	ServicePtr	Development:SIMNET:CEW: ServiceObj.h		
q	ServicePtr	Development:SIMNET:CEW: ServiceObj.h		
	Calls	-		
Function	Where Described			
DisposPtr	Standard Memory Manager function for Macintosh.			
	Called By			
Function	Where Described			
CheckQs	See Section 2.19.5.11.4.			

Table 2.19-164 ServiceObj::DeleteService Information.

2.19.5.11.4 ServiceObj::CheckQs

ServiceObj::CheckQs checks all the services on the queue for start times, resource arrival times, and completion.

If a scheduled mission's execution time has occurred, the routine checks the mission's order type. If the order type is Warn, the routine pops up a dialog to the user allowing the user to choose to either execute or abort the mission. If the order type is Execute, the routine executes the mission. If the resources allocated to the mission have had a change in status, the mission is aborted.

Pending missions are checked, and are removed from the ServiceList if they have completed. Move missions are checked, and their activity started if the resources have completed their travelling.

The function call is ServiceObj::CheckQs(). Table 2.19-165 describes the internal variables used and functions called using this function.

Internal Variables				
Variable	Type	Where Typedef Declared		
р	ServicePtr	Development:SIMNET:CEW:		
		ServiceObj.h		
q	ServicePtr	Development:SIMNET:CEW:		
		ServiceObj.h

	Calls	
Function	Where Described	
MissionObj::show	See Section 2.19.5.7.4.	

Table 2.19-166 ServiceObj::ShowQ Information.

2.19.5.11.6 ServiceObj::UpdateQs

ServiceObj::UpdateQs checks the service queues for any events occurring at the current time. The function call is ServiceObj::UpdateQs(). Table 2.19-167 describes the internal variables used and functions called using this function.

Internal Variables			
Variable Type Where Typedef D			
now	unsigned long	Standard C type.	
	Calls		
Function	Where Described		
GetDateTime	Standard Operating System Utility function for Macintosh.		
CheckQs	See Section 2.19.5.11.4.		
	Called By		
Function	Where Described		
MainEventLoop	See Section 2.19.2.1.2	2.	

Table 2.19-167 ServiceObj::UpdateQs Information.

2.19.5.12 ServiceObj.h

Development:SIMNET:MCC:CEW:ServiceObj.h

This file defines the Service structure type and declares the ServiceObj class.

2.19.5.13 Simple_Windows.c

Development:SIMNET:MCC:CEW:Simple_Window.c

This file implements the Swindow object utilities.

2.19.5.13.1 Swindow::init

Swindow::init initializes and allocates an instance of an Swindow object. *ID* specifies the ID number of the window; *func* specifies the simple window's update function. The function call is Swindow::init(short ID, ProcPtr func). Table 2.19-168 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
ID	short	Standard C type.
func	ProcPtr	Development:THINK C: Mac #includes:MacTypes.h
	Return Values	
Return Value	Туре	Meaning
this	pointer to Swindow	A handle to the Swindow object created.
	Calls	
Function	Where Described	
NewPtr	Standard Memory Manager function for Macintosh.	
GetNewWindow	Standard Window Manage	er function for Macintosh.
	Called By	
Function	Where Described	
ComWindow::initial	See Section 2.19.5.3.3.	

Table 2.19-168 Swindow::init Information.

2.19.5.13.2 Swindow::show

Swindow::show makes the simple window visible. The function call is Swindow::show(). Table 2.19-169 describes the functions called using this function.

Calls	
Function Where Described	
ShowWindow	Standard Window Manager function for Macintosh.
SetPort	Standard Quickdraw function for Macintosh.
	Called By
Function	Where Described
ComWindow::show	See Section 2.19.5.3.1.
BringToFront	See Section 2.19.5.13.9.

Table 2.19-169 Swindow::show Information.

2.19.5.13.3 Swindow::quit

Swindow::quit closes this simple window, cleaning up its memory allocations. The function call is Swindow::quit(). Table 2.19-170 describes the functions called using this function.

Calls		
Function	Where Described	
DisposeWindow	Standard Window Manager function for Macintosh.	
DisposPtr	Standard Memory Manager function for Macintosh.	
	Called By	
Function	Where Described	
MacQuit	See Section 2.19.2.1.4.	
DoneStatus	See Section 2.19.3.8.5.	
OtherEventLoop	See Section 2.19.3.8.7.	

Table 2.19-170 Swindow::quit Information.

2.19.5.13.4 Swindow::update

Swindow::update redraws the simple window, calling the toolbox functions BeginUpdate and EndUpdate. The function call is Swindow::update(). Table 2.19-171 describes the internal variables used and functions called using this function.

	Internal Varia	ables	
Variable	Туре	Where Typedef Declared	
cport	GrafPtr	Development:THINK C: Mac #includes:	
	Calls		
Function	Where Described		
GetPort	Standard Quickdraw function for Macintosh.		
SetPort	Standard Quickdraw function for Macintosh.		
BeginUpdate	Standard Window Manager function for Macintosh.		
EndUpdate	Standard Window M	anager function for Macintosh.	
	Called By		
Function	Where Described		
ReviewSelection	See Section 2.19.3	.2.15.	
MissionSelection	See Section 2.19.3	See Section 2.19.3.5.3.	
OtherEventLoop	See Section 2.19.3	.8.7.	

Table 2.19-171 Swindow::update Information.

2.19.5.13.5 Swindow::hide

Swindow::hide makes the simple window not visible. The function call is

Swindow::hide(). Table 2.19-172 describes the functions called using this function.

Calls	
Function	Where Described
HideWindow	Standard Window Manager function for Macintosh.

Table 2.19-172 Swindow::hide Information.

2.19.5.13.6 Swindow::IsVisible

Swindow::IsVisible returns a flag which says whether or not this simple window is visible. The function call is Swindow::IsVisible(). Table 2.19-173 describes the values returned by this function.

Return Values		
Return Value	Туре	Meaning
visible	short	If 0, the Swindow is not visible; If 1, the Swindow is visible.
	Called By	
Function	Where Described	
PrintWindow	See Section 2.19.3.6.1.	
RefreshWindow	See Section 2.19.3.8.3.	

Table 2.19-173 Swindow::IsVisible Information.

2.19.5.13.7 Swindow::close

Swindow::close closes this simple window. The window is taken down and made not visible. The function call is Swindow::close(). Table 2.19-174 describes the functions called using this function.

Calls	
Function	Where Described
CloseWindow	Standard Window Manager function for Macintosh.

Table 2.19-174 Swindow::close Information.

2.19.5.13.8 Swindow::equal

Swindow::equal determines if *other* is the same simple window as this object instance. The function call is Swindow::equal(WindowPtr other). Table 2.19-175 describes the parameters used by this function.

	Parameter	S
Parameter	Type	Where Typedef Declared
other	WindowPtr	Development:THINK C: Mac #includes:WindowMgr.h

Return Values		
Return Value	Туре	Meaning
window == other	Boolean	TRUE if other is the same simple window; FALSE if other is not the same simple window.
	Called By	
Function	Where Described	
MainEventLoop	See Section 2.19.2.1.2.	
OtherEventLoop	See Section 2.19.3.8.7.	

Table 2.19-175 Swindow::equal Information.

2.19.5.13.9 Swindow::BringToFront

Swindow::BringToFront brings this Swindow to the front of the screen. The function call is Swindow::BringToFront(). Table 2.19-176 describes the functions called using this function.

Calls	
Function Where Described	
show	See Section 2.19.5.13.2.
HiliteWindow	Standard Window Manager function for Macintosh.
SelectWindow	Standard Window Manager function for Macintosh.
SetPort	Standard Quickdraw function for Macintosh.

Table 2.19-176 Swindow::BringToFront Information.

2.19.5.13.10 Swindow::GetWindowPtr

Swindow::GetWindowPtr returns the window pointer of this Swindow object. The function call is Swindow::GetWindowPtr(). Table 2.19-177 describes the values returned by this function.

Return Values			
Return Value	Туре	Meaning	
window	WindowPtr	The window pointer of this simple window object.	
	Called By		
Function	Where Described		
MainEventLoop	See Section 2.19.2.1.2.		
PrintWindow	See Section 2.19.3.6.1.		
SetupResWindow	See Section 2.19.3.8.2.		
RefreshWindow	See Section 2.19.3.8.3		
DoneStatus	See Section 2.19.3.8.5.		
OtherEventLoop	See Section 2.19.3.8.7.		

Table 2.19-177 Swindow::GetWindowPtr Information.

2.19.5.14 Simple Windows.h Development:SIMNET:MCC:CEW:simple_Windows.h

This file contains the declaration of the Swindow class.

2.19.5.15 TextList.c

Development:SIMNET:MCC:CEW:TextList.c

This file implements the TextList objects.

2.19.5.15.1 TextList::init

TextList::init allocates and initializes an instance of a TextList object. window is the window in which the list appears; r is the rectangle containing the list's viewable content. The function call is TextList::init(WindowPtr window, Rect r). Table 2.19-178 describes the parameters used and functions called using this function.

	Parameter	s
Parameter	Type	Where Typedef Declared
window	WindowPtr	Development:THINK C:
		Mac #includes:WindowMgr.h
r	Rect	Development:THINK C:
<u>-</u>		Mac #includes:MacTypes.h
	Internal Varia	bles
Variable	Type	Where Typedef Declared
cell_size	Cell	Development:THINK C:
	<u></u>	Mac #includes:ListMgr.h
datab	Rect	Development:THINK C:
		Mac #includes:MacTypes.h
listrect	Rect	Development:THINK C:
		Mac #includes:MacTypes.h
	Return Valu	es
Return Value	Type	Meaning
(Handle) this	Handle	A handle to the TextList object
		created.
	Calls	
Function	Where Described	
SetRect	Standard Quickdraw function for Macintosh.	
SetPt	Standard Quickdraw f	function for Macintosh.
LNew	Standard List Manage	er function for Macintosh
LSetSelect	Standard List Manage	er function for Macintosh
LDoDraw		er function for Macintosh
LUpdate		er function for Macintosh
FrameRect		function for Macintosh.

Called By		
Function	Where Described	
main	See Section 2.19.2.1.1.	
SetupResWindow	See Section 2.19.3.8.2.	

Table 2.19-178 TextList::init Information.

2.19.5.15.2 TextList::ListUpdate

TextList::ListUpdate redraws the text list. The function call is TextList::ListUpdate(). Table 2.19-179 describes the functions called using this function.

Calls		
Function	Where Described	
LUpdate	Standard List Manager function for Macintosh	
FrameRect	Standard Quickdraw function for Macintosh.	
	Called By	
Function	Where Described	
ResourceItems	See Section 2.19.3.7.1.	
	See Section 2.19.3.8.3.	

Table 2.19-179 TextList::ListUpdate Information.

2.19.5.15.3 TextList::ListDispose

TextList::ListDispose removes (or disposes) this text list. The function call is TextList::ListDispose(). Table 2.19-180 describes the functions called using this function.

Calls		
Function	Where Described	
_Dispose Standard List Manager function for Macintosh		
	Called By	
Function	Where Described	
MacQuit	See Section 2.19.2.1.4.	
DeleteResourceLists	See Section 2.19.3.7.3.	
DoneStatus	See Section 2.19.3.8.5.	
OtherEventLoop	See Section 2.19.3.8.7.	

Table 2.19-180 TextList::ListDispose Information.

2.19.5.15.4 TextList::GetCellRect

TextList::GetCellRect returns the rectangle surrounding a cell (or row) in the TextList. rcwNum specifies the cell. The function call is TextList::GetCellRect(short rowNum). Table 2.19-181 describes the parameters used and functions called using this function.

Parameter	Type	Where Typedef Declared
rowNum	short	Standard C type.

	Internal Var	lables
Variable	Туре	Where Typedef Declared

2.19.5.16 TextList.h
Development:SIMNET:MCC:CEW:TextList.h

This file contains the declaration of the TextList class.

2.20 The Network Communication Libraries

There are a number of shared libraries that various processes of the MCC use. Below is a section on each library with a brief description of the functions it provides. This structure of this CSC is shown in Figure 2.20-1.

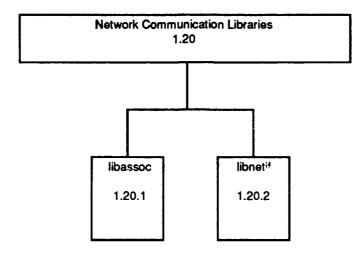

Figure 2.20-1: Network Communication Libraries.

2.20.1 libassoc

The SIMNET Association Layer provides network services to send/receive datagrams and exactly once (xo) transactions. It also provides a subscription service to multicast addresses on the network, allowing an individual application to selectively accept or reject network traffic from different SIMNET exercises, and different protocols within an exercise. More information on the Association Layer can be found in "BBN Report No. 7102, The SIMNET Network and Protocols". Libassoc communicates with the network through libnetif to provide these services.

Libassoc allows an application to open multiple association channels, one per network device to be used. Once a channel is opened, it is referred to by the application through a unique handle, which is returned after successfully opening the channel.

When an error occurs in a libassoc function, it is indicated by an otherwise impossible returned value. This is almost always -1; the individual descriptions specify the details. An error number is made available in the external variable assoc_error. Table 2.20-1 lists the various libassoc errors.

Error #	Error Name	Description
1	ANETOPEN	Could not open network - The net_open call to libnetif failed. Make sure the network is up and running.
3	ANETACCESS	Could not access network - This is a catch-all for failed calls into libnetif. Once the network has successfully been opened, the most common problem is running out of send buffers. Additional information on failed net calls is available by checking errno (Section 2.20.2 libnetif).
4	ABADHANDLE	Invalid channel handle - The only valid handle is one returned by AssocOpen. Either AssocOpen has not been called, AssocOpen failed and you didn't check the return code (!), or your application has somehow corrupted the handle returned to it by AssocOpen.
6	AFILEOPEN	Could not open file - Currently, the only file that libassoc opens is the "assocDef" file as passed to AssocOpen. Make sure that it has been specified correctly, your application has permission to read it, etc.
7	APARM	Invalid parameter - There is an error in the assocDef file. See the information on AssocDef below which explains how to build an assocDef file.
8	ANOMEMORY	Could not malloc memory - If this error occurs on startup, the INITIAL_DESCRIPTORS parameter is probably too large for the given architecture. If it occurs at some later time, the ADDITIONAL_DESCRIPTORS parameter may be too large, or perhaps descriptors aren't being freed. Make sure that AssocTickAssocLayer is being called.
11	AMAXSUBSCRIBED	Maximum subscriptions exceeded - There is a hard limit to the number of subscriptions allowed by the network interface, as well as a user-definable limit for libassoc. This error occurs if either is exceeded.
12	APKT2BIG	Packet size or threshold too large - Either a request to send a packet larger than the network layer will handle, or in the case of aggregated packets, a threshold size that is too large.

Table 2.20-1 Libassoc Errors.

2.20.1.1 subscribe.c

/simnet/libsrc/libassoc/subscribe.c

subscribe.c contains routines for subscribing to and unsubscribing from multicast groups. Table 2.20-2 describes the variables used by subscribe.c.

Variables		
Variable	Type	Where Typedef Declared
Errno	extern int	Standard C type.

Table 2.20-2 subscribe.c Variable Information.

2.20.1.1.1 AssocSubscribe

AssocSubscribe subscribes to a multicast group. The routine creates a multicast Ethernet address from the *group* and *protocol* parameters and directs the network interface to start listening to packets with this multicast address. No packets will be received until at least one multicast address has been subscribed to. The *handle* parameter is a low integer referencing the network channel connection. The function call is AssocSubscribe(handle, group, protocol). Table 2.20-3 describes the parameters used, return values and possible errors generated by using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type.
group	MulticastGroupID	/simnet/common/include/prot ocol/p_assoc.h
protocol	AssociationUserProtocol	/simnet/common/include/prot ocol/p_assoc.h
	Return Values	
Return Value	Туре	Meaning
-1	int	Unsuccessful.
0	int	Successful.
	Errors	
Error Name	Reason for Error	
ANETACCESS	Cannot access interface to the Ethernet	
AMAXSUBSCRIBED	Ethernet already has subscribed to a maximum number of	
ABADHANDLE	multicast addresses. Invalid handle (have you called AssocOpen()?)	
	Calis	
Function	Where Described	
AssocSubscribeWithMask	Section 2.20.1,1,4.	

Table 2.20-3 AssocSubscribe Information.

2.20.1.1.2 AssocUnsubscribe

AssocUnsubscribe unsubscribes from a multicast group. The routine directs the network interface to stop listening to packets with the multicast address formed from the *group* and *protocol* parameters. The *handle* parameter is a low integer referencing the network channel connection. The function call is AssocUnsubscribe(handle, group, protocol). Table 2.20-4 describes the parameters used, return values and possible errors generated by using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type.
group	MulticastGroupID	/simnet/common/include/prot ocol/p_assoc.h
protocol	AssociationUserProtocol	/simnet/common/include/prot ocol/p_assoc.h
	Return Values	
Return Value	Туре	Meaning
-1	int	Unsuccessful.
0	int	Successful.
	Errors	
Error Name	Reason for Error	
ANETACCESS	Cannot access interface to the	he Ethernet
ABADHANDLE	Invalid handle (have you calle	ed AssocOpen()?)
	Calls	
Function	Where Described	
AssocUnsubscribeWithMask	Section 2.21.1.1.5.	

Table 2.20-4 AssocUnsubscribe Information.

2.20.1.1.3 AssocCurrentlySubscribed

AssocCurrentlySubscribed checks to see if the application is currently subscribed to the multicaste group address formed by the *group* and *protocol* parameters. The *handle* parameter is a low integer referencing the network channel connection. The function call is AssocCurrentlySubscribed(handle, group, protocol). Table 2.20-5 describes the parameters used and return values generated by using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type.
group	MulticastGroupID	/simnet/common/include/prot ocol/p_assoc.h
protocol	AssociationUserProtocol	/simnet/common/include/prot ocol/p_assoc.h

	Return Values	
Return Value	Туре	Meaning
1	int	Currently subscribed.
0	int	Not currently subscribed.
	Calls	
Function	Where Described	
AssocCurrentlySubscribedWithMask	Section 2.20.1.1.6.	

Table 2.20-5 AssocCurrentlySubscribed Information.

2.20.1.1.4 AssocSubscribeWithMask

AssocSubscribeWithMask subscribes to a private multicast group (analogous to AssocSubscribe described above). Reference AssocCreatMCAWithMask() in Section 2.20.1.1.8 for a description of the mask. The function call is AssocSubscribeWithMask(handle, group, protocol, mask). Table 2.20-6 describes the parameters used, return values and possible errors generated by using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type.
group	MulticastGroupID	/simnet/common/include/prot ocol/p_assoc.h
protocol	AssociationUserProtocol	/simnet/common/include/prot ocol/p_assoc.h
mask	unsigned long	Standard C type.

Function	Where Described	
AssocCurrentlySubscribed	Section 2.20.1.1.3.	

Table 2.20-8 AssocCurrentlySubscribedWithMask Information.

2.20.1.1.7 AssocCreateMCA

AssocCreateMCA creates the Multicast Group Address in the buffer pointed to by address using the group and protocol parameters as described in AssocCreateMCAWithMask using a mask of zero. The function call is AssocCreateMCAWithMask(group, protocol, address, mask). Table 2.20-9 describes the parameters used, return values and possible errors generated by using this function.

Parameters		
Parameter	Type	Where Typedef Declared
group	MulticastGroupID	/simnet/common/include/prot ocol/p_assoc.h
protocol	AssociationUserProtocol	/simnet/common/include/prot ocol/p_assoc.h
mask	unsigned long	Standard C type.
address	pointer to NetworkAddress	/simnet/libsrc/libnetif/network. h
	0-11	
	Calls	
Function	Where Described	
AssocCreateMCAWithMask	Section 2.20.1.1.7.	

Table 2.20-9 AssocCreateMCA Information.

2.20.1.1.8 AssocCreateMCAWithMask

AssocCreateMCAWithMask creates a multicast group address using group, protocol and mask as follows:

Because bits are transmitted from lowest addressed bit to highest addressed bit, a NetworkAddress looks like this:

7 6 5 4 3 2 1 0 15 14 13 12 11 10 9 8 23 22 21 20 19 18 17 16 31 30 29 28 27 26 25 etc.

Bit 0 gets a 1, bit 1 gets a 1, bits 2->7 get 0s, bits 8->31 get bits 0->23 of the mask, bits 32->39 get the group number, and bits 40->47 get the protocol number. This functionality is considered an extension to, rather than a part of, the association layer.

The function call is AssocCreateMCA(group, protocol, mask, address). Table 2.20-10 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
group	MulticastGroupID	/simnet/common/include/prot ocol/p_assoc.h
protocol	AssociationUserProtocol	/simnet/common/include/prot ocol/p_assoc.h
address	pointer to NetworkAddress	/simnet/libsrc/libnetif/network.
mask	unsigned long	Standard C type.

	Internal Variables	
Variable	Туре	Where Typedef Declared
addr	register pointer to char	Standard C type.

Table 2.20-13 send.c Variable Information.

2.20.1.2.1 AssocSendDatagram

AssocSendDatagram sends an Association Datagram to the multicast group defined by group and protocol, and current send mask. data points to the data to be contained in the datagram. length is the number of bytes pointed to by data. The function call is AssocSendDatagram(handle, data, length, group, protocol). Table 2.20-14 describes the parameters used, return values and possible errors generated by using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type.
data	pointer to char	Standard C type.
length	long int	Standard C type.

2.20.1.2.2 AssocPadBuffer

AssocPadBuffer expects a pointer to the beginning of a data buffer aPDU and the current length of the buffer. It adds a padding PDU to the end of the PDU in order to bring the total size up to MIN_DATA_SIZE_8023. The function call is AssocPadBuffer(apdu, bufferLength). Table 2.20-15 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared

Table 2.20-15 AssocPadBuffer Information.

2.20.1.3 aggregate.c

/simnet/libsrc/libassoc/aggregate.c

aggregate.c contains routines for sending aggregated datagrams.

2.20.1.3.1 AssocSendAggregate

AssocSendAggregate adds this PDU to a buffer of PDUs of the same group and protocol. If the current buffer of PDUs has a different group or protocol, or if the current send mask has changed, that buffer is written to the net and a new buffer is filled with the current PDU. data is a pointer to the current PDU to be sent and length is the number of bytes pointed to by data. timer is the number of milliseconds the PDU can wait before being sent. threshold is the maximum number of bytes allowed in the aggregated packet. To send a PDU out immediately and thus flush the current buffer, set threshold to 0. Aggregate PDUs are sent to the multicast group formed by the group and protocol common to all of the PDUs in the buffer and the send mask in force while it was built. The function

call is AssocSendAggregate(handle, data, length, group, protocol, timer, threshold). Table 2.20-16 describes the parameters used, return values and possible errors generated by using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared

Table 2.20-16 AssocSendAggregate Information.

2.20.1.4 transact.c

/simnet/libsrc/libassoc/transact.c

transact.c contains routines to interface the host to the transaction protocol capabilities of the association layer library.

2.20.1.4.1 AssocSendTransact

AssocSendTransact sends an Association Transaction PDU directed to respondent and visible to any other observer subscribed to the Ethernet multicast address described by the group and protocol pair, in conjunction with the current send mask. respondent must also be subscribed to this multicast address. data points to the data to be transmitted and length is the number of bytes in data.

If a response to this transaction is received, the *callback* routine will be called with the user-specified *cparam* as one of its parameters. If the transaction times out before a response is received, the *timeout* routine will be called with the used-specified *tparam* as one of its parameters. Note that cparam and tparam must point to space that is statically allocated by the application. When a response is received, the application is notified via the primitive parameter to the AssocReceivePDU routine. No such notification is given in the case of timeout, however.

The callback routine should be defined by the application as:

int callback(data, length, respondent, cparam) char data; long int length; SimulationAddress respondent; long int cparam;

where *respondent* is the Simulation Address of the simulator which has responded to the transaction. *length* is the number of bytes in the information pointed to by *data*. *cparam* is a user supplied parameter which may be used to store extra information for the transaction. cparam must point to storage which is allocated by the application.

The timeout routine should be defined by the application as:

int timeout(data, length, respondent, tparam) char data; long int length; SimulationAddress respondent; long int tparam;

where *respondent* is the Simulation Address of the simulator who was supposed to respond to the transaction. *length* is the number of bytes in the information pointed to by *data*, which is the original PDU sent by the application. *tparam* is a user supplied parameter which may be used to store extra information for the transaction. Again, tparam must point to storage which is allocated by the application.

The function call is AssocSendTransact(handle, data, length, group, protocol, respondent, callback, cparam, timeout, tparam). Table 2.20-17 describes the parameters used, return values and possible errors generated by using this function.

Parameters			
Parameter	Туре	Where Typedef Declared

Table 2.20-17 AssocSendTransact Information.

2.20.1.4.2 AssocSendResponse

AssocSendResponse sends an Association Response PDU directed to the originator of the transaction. Any observers subscribed to the Ethernet multicast address described by the same group, protocol and send mask as the transaction can also listen to the response. Note that the send mask of the last transaction received is used for the response, not the current send mask of the respondee. This behavior may be modified by using AssocSetRspMask. cache_response should be TRUE if the association entity should respond to subsequent retries with the same response. cache_response should be FALSE if the application wishes to hear each retry. data points to the data in the response and length is the number of bytes pointed to by data. transID must be the same transID as the original request. The function call is AssocSendResponse(handle, data, length, group, protocol,originator, transID, cache_response). Table 2.20-18 describes the parameters used, return values and possible errors generated by using this function.

Parameters		
Parameter	Туре	Where Typedef Declared

2.20.1.5 open.c

/simnet/libsrc/libassoc/open.c

open.c contains routines to initialize the association layer. Table 2.20-19 describes the variables used by open.c.

Variables		
Variable	Туре	Where Typedef Declared
errno	extern int	Standard C type.
channelMap	pointer to array size maxChannels of ChannelDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
assocPaddingPDU	AssociationPDU	/simnet/common/include/prot ocol/p_assoc.h

Table 2.20-19 open.c Variable Information.

2.20.1.5.1 AssocOpen

AssocOpen resets the network interface and opens a channel to the specified network. It allocates and initializes all data structures and variables needed by the association network entity. device is the name of the device you wish to open (e.g. "/dev/enp0"). assocDef is the name of the file to use for association layer definitions/parameters. AssocOpen resets the network interface to insure that the device is not in promiscuous mode, that no multicast groups are currently subscribed to, that the ethernet type code (AssocFamily) is set to the default, and that the input and output buffers are flushed. A number of defaults for the channel are set. Some of these defaults are modifiable by entries in the assocDef file. AssocDef parameters are described in Table 2.20-80.

This routine returns a handle to a network interface that must be used for subsequent association library calls, and may be used directly for network (libnetif) calls. Either AssocOpen or AssocAttach must be called before any other association routine is called. The function call is AssocOpen(device, assocDef). Table 2.20-20 describes the parameters used, return values and possible errors generated by using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
device	pointer to char	Standard C type.	
assocDef	pointer to char	Standard C type.	
	Internal Variables

2.20.1.6 receive.c

/simnet/libsrc/libassoc/receive.c

receive.c contains routines to receive packets for the SIMNET network through the association layer. Table 2.20-23 describes the variables used by receive.c.

Variables		
Variable	Type	Where Typedef Declared
errno	extern int	Standard C type.

Table 2.20-23 receive.c Variable Information.

2.20.1.6.1 AssocReceivePDU

AssocReceivePDU queries the Association Layer for PDU's from the network. The routine gets a pointer to the next PDU and sets what the data pointer (*data) to the PDU pointer when appropriate. The data pointer will not be set if the PDU is a response to a transaction the application issued or if the PDU is a retry for which the application has a response cached. If the PDU is a response to a transaction the application issued, the association entity calls the supplied callback routine and returns with primitive equal to ASSOC_TRANSACT_CONF. If the PDU is a retry request for which the application has a cached response, the association entity retransmits the response and returns with primitive equal to ASSOC_NOTHING_OF_INTEREST. When AssocReceivePDU returns a PDU, protocol is the user protocol to which the PDU belongs, and primitive indicates whether the PDU is a datagram, request, etc., as defined in "assoc.h". length is the number of bytes in the information pointed to by data. The function call is AssocReceivePDU(handle, data, length, group, protocol, primitive, originator, transID, respondent). Table 2.20-24 describes the parameters used, return values and possible errors generated by using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type.
data	pointer to pointer to char	Standard C type.
length	pointer to long int	Standard C type.

Table 2.20-25 lists the values returned in primitive.

Value	Description
ASSOC_NOTHING_OF_INTEREST	Padding PDU or Association Layer retransmitted a cached response.
ASSOC_DATAGRAM_IND	Datagram PDU.
ASSOC_REQUEST_IND	Transaction request to which we are an observer.
ASSOC_RESPONSE_IND	Transaction response to which we are an observer.
ASSOC TRANSACT IND	Transaction request destined for my host.
ASSOC_TRANSACT_CONF	Association layer process a callback routine.

Table 2.20-25 Values Returned in Primitive of AssocReceivePDU.

2.20.1.7 block.c

/simnet/libsrc/libassoc/block.c

block.c contains routines to receive packets from the SIMNET network through the association layer. It differs from receive.c (Section 2.20.1.6.) in that calls to AssocWaitForPDU block on the network.

2.20.1.7.1 AssocWaitForPDU

AssocWaitForPDU queries the Association Layer for PDUs from the net, reads the Association PDU, and sets *data to the address of the PDU. AssocWaitForPDU will block until a packet is received from the network. The packet is then processed in the same manner as in Section 2.20.1.6.1 AssocReceivePDU, except that if there is no data to be returned to the application from that packet, the routine again blocks on the network, until there is a PDU to return. The function call is AssocWaitForPDU(handle, data, length, group, protocol, primitive, originator, transID, respondent). Table 2.20-26 describes the parameters used, return values and possible errors generated by using this function.

	Parameters	•

2.20.1.8 tick.c

/simnet/libsrc/libassoc/tick.c

tick.c contains routines which perform time related functions of the Association service.

2.20.1.8.1 AssocTickAssocLayer

AssocTickAssocLayer performs time-related functions of the Association service. It will issue retries for those Association Transactions that have not yet received a response and calls a callback routine for those transactions that have timed out to indicate a failed transaction. The callback routine is the one that was specified in the initial call to AssocSendTransact(). If no callback routine was supplied, the transaction is simply cleared. It will clear cached responses that have timed out and send out expired aggregate packets. AssocTickAssocLayer must be called by the application in order to perform these activities and should be called at least once a second to conform to the SIMNET 6.0 protocol. AssocTickAssocLayer replaces AssocUpdateTransactions. The function call is AssocTickAssocLayer(handle). Table 2.20-28 describes the parameters used, return values and possible errors generated by using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
handle	int	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
channel	register pointer to	/simnet/libsrc/libassoc/assoc_l
	ChannelDescriptor	cl.h
	Return Values

Table 2.20-28 AssocTickAssocLayer Information.

2.20.1.8.2 UpdateTransactions

UpdateTransactions is called by AssocTickAssocLayer in order to retry transactions and time out old cached responses. The function call is UpdateTransactions(handle). Table 2.20-29 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
t1	register pointer to	/simnet/libsrc/libassoc/assoc_
	AssocTransDescriptor	cl.h

Table 2.20-29 UpdateTransactions Information.

2.20.1.9 address.c

/simnet/libsrc/libassoc/address.c

address.c contains a routine to get a Simulation Address.

2.20.1.9.1 AssocGetSimAddress

AssocGetSimAddress gets the hosts simulation address. It sets *simAddress* to the site and host numbers of the simulation entity referenced by *handle*. These are taken from the definition file given to AssocOpen(). The function call is AssocGetSimAddress(handle, simAddress). Table 2.20-30 describes the parameters used, return values and possible errors generated by using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type.
simAddress	pointer to SimulationAddress	/simnet/common/include/prot ocol/address.h
	Return Values	
Return Value	Туре	Meaning
-1	int	Unsuccessful.
0	int	Successful.
	Errors	
Error Name	Reason for Error	
ABADHANDLE	Invalid network handle.	

	Calls
Function	Where Described
ASSOC CHECK HANDLE	Macro defined in /simnet/libsrc/libassoc/assoc_lcl.h.

Table 2.20-30 AssocGetSimAddress Information.

2.20.1.10 error.c

/simnet/libsrc/libassoc/error.c

error.c contains all the definitions and routines used for the association layer library's error handling service. Table 2.20-31 describes the variables used by error.c.

Variables		
Variable	Туре	Where Typedef Declared
assoc_errno	int	Standard C type.
errorList	pointer to array MAX_ERROR_STRINGS of char	Standard C type.

Table 2.20-31 error.c Variable Information.

2.20.1.10.1 AssocError

AssocError returns a pointer to a static string that describes the last error encountered during an association library call. The error is obtained by the value in the external variable assoc_error. AssocError returns a pointer to the string "Error 0" if assoc_erroo equals 0. Table 2.20-32 describes the return values generated by this function.

Return Values		
Return Value	Type	Meaning
errorList	pointer to array assoc_errno of char	String for a valid error number.
errorList	pointer to array MAX_ERROR_STRINGS of char	String for an invalid error number.

2.20.1.11 close.c

/sinmet/libsrc/libassoc/close.c

close.c contains a routine to close an association layer channel.

2.20.1.11.1 AssocClose

AssocClose deallocates all memory allocated for a channel, unsubscribes from all subscribed multicast groups and closes the network connection. The function call is AssocClose(handle). Table 2.20-33 describes the parameters used, return values and possible errors generated by using this function.

	Paramet	ers
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type

internal Variables		
Variable	Туре	Where Typedef Declared
channel	pointer to rgister ChannelDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h

Table 2.20-33 AssocClose Information.

2.20.1.12 family.c

/simnet/libsrc/libassoc/family.c

family.c contains a routine to establish a protocol family to be used for a channel.

2.20.1.12.1 AssocSetProtocolFamily

AssocSetProtocolFamily re-initializes the network layer to not accept packets of any type, except the specified family. This is currently done using the ethernet type code. This call is only needed to change types from the default specified in the channel's assocDef file. Family types are defined in assoc.h. They include:

AssocFamilySimnet	listens to SIMNET packets
AssocFamilyData	for network development only
AssocFamilyVoice	listen to voice (radio) packets
AssocFamilyGT	listen to GT sim/cig packets

The function call is AssocSetProtocolFamily(handle, family). Table 2.20-34 describes the parameters used, return values and possible errors generated by using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type.
family	int	Standard C type.

Return Values		
Return Value	Type	Meaning
-1	int	Call failed.
0	int	New family is set.
	Erro	rs
Error Name	Reason for E	ror
ANETACCESS	Cannot access interface to the Ethernet.

Table 2.20-34 AssocSetProtocolFamily Information.

2.20.1.13 mask.c

/simnet/libsrc/libassoc/mask.c

mask.c contains routines to use address masks. Address masks allow the user to utilize available bits in the ethernet multicast address to create private multicast groups. This is considered and extension to, not part of, the Association Layer.

2.20.1.13.1 AssocSetSendMask

AssocSetSendMask allows the used to specify a mask to be bit-wise ORed into a multicast destination address before it is sent. This allows users to form private multicast groups. Bits 0->23 of the mask are ORed with bits 8->31 of the destination address to form bits 8->31 of the actual multicast address to be used. Normally, these bits are 0. The mask set by AssocSetSendMask is used for sending datagrams and transaction requests. Transaction responses normally use the mask in the address to which the originator sent the request. The function call is AssocSetSendMask(handle, mask). Table 2.20-35 describes the parameters used, return values and possible errors generated by using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type.
mask	unsigned long	Standard C type.
	Return Values	3
Return Value	Type	Meaning
-1	int	Unsuccessful.
0	int	Successful.

ASSOC CHECK HANDLE	Macro defined in /simnet/libsrc/libassoc/assoc_lcl.h.

Table 2.20-35 AssocSetSendMask Information.

2.20.1.13.2 AssocGetRspMask

AssocGetRspMask is used in conjunction with AssocSetRspMask to allow the user to process transactions in different groups out of order. AssocGetRspMask is used to retrieve a response mask when a transaction is first received. The mask is then used by AssocSetRspMask in the response. The function call is AssocGetRspMask(handle, mask). Table 2.20-36 describes the parameters used, return values and possible errors generated by using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type.
mask	unsigned long	Standard C type.
	Return Values	5
Return Value	Type	Meaning
-1	int	Unsuccessful.

Table 2.20-37 AssocSetRspMask Information.

2.20.1.14 raw.c

/simnet/libsrc/libassoc/raw.c

raw.c contains a routine to receive raw Association PDUs from the SIMNET network through the association layer. Table 2.20-38 describes the variables used by raw.c.

	Variables	
Variable	Туре	Where Typedef Declared
errno	extern int	Standard C type.

Table 2.20-38 raw.c Variable Information.

2.20.1.14.1 AssocReceiveAssocPDU

AssocReceiveAssocPDU gets a pointer to the next available Association PDU (APDU) in the network buffers and sets what data points to to this pointer when appropriate. The data pointer will not be set if the APDU is a response to a transaction the application issued or if the APDU is a retry for which the application has a response cached. If the APDU is a response to a transaction the application issued, the association entity calls the supplied callback routine and returns with primitive equal to ASSOC_TRANSACT_CONF. If the APDU is a retry request for which the application has a cached response, the association entity retransmits the response and returns with primitive equal to ASSOC_NOTHING_OF_INTEREST. When AssocReceiveAssocPDU returns a pointer to an APDU, protocol is the user protocol to which the PDU contained in the APDU belongs, and primitive indicates whether the PDU is a datagram, request, etc., as defined in "assoc.h". length is the number of bytes in the information pointed to by data. The function call is AssocReceiveAssocPDU(handle, data, length, primitive). Table 2.20-39 describes the parameters used, return values and possible errors generated by using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type.
data	pointer to pointer to char	Standard C type.
length	pointer to long int	Standard C type.
primitive	pointer to long int	Standard C type.

Value	Description
ASSOC_NOTHING_OF_INTEREST	Padding PDU or Association Layer retransmitted a cached response.
ASSOC_DATAGRAM_IND	Datagram PDU.
ASSOC REQUEST IND	Transaction request to which we are an observer.
ASSOC RESPONSE IND	Transaction response to which we are an observer.
ASSOC TRANSACT_IND	Transaction request destined for my host.
ASSOC_TRANSACT_CONF	Association layer process a callback routine.

Table 2.20-40 Values Returned in Primitive of AssocReceiveAssocPDU.

2.20.1.15 who.c

/simnet/libsrc/libassoc/who.c

who.c contains a routine to determine the ethernet addres of the current packet on each channel.

2.20.1.15.1 AssocGetLastAddress

AssocGetLastAddress sets the buffer pointed to by who to the physical ethernet address of the sender of the last packet which was returned to the application (or Null if none has been received). This can be useful for debugging the network. This is considered an extension to, rather than a part of, the association layer. The function call is AssocGetLastAddress(handle, who). Table 2.20-41 describes the parameters used, return values and possible errors generated by using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
handle	int	Standard C type.
who	pointer to NetworkAddress	/simnet/libsrc/libnetif/network.
	Return Values	
Dolum Volus		Teaconing
Return Value	Туре	Meaning
-1	int	Unsuccessful.
0	int	Successful.

Table 2.20-41 AssocGetLastAddress Information.

2.20.1.16 time_list.c /simnet/libsrc/libassoc/time_list.c

time_list.c contains routines used to maintain linked lists of pending transactions. These lists are linked in order by time. Each transaction in the list has a pointer to the previous transaction in time (the timeFront pointer) and to the next transaction in time (the timeRear pointer).

2.20.1.16.1 AssocAddToStartOfTimeList

AssocAddToStartOfTimeList adds the transactiontd to the start of the TimeList. The routine makes sure that startTimeList points to the first transaction pointer on the TimeList and endTimeList points to the last transaction pointer on the TimeList. The function call is AssocAddToStartOfTimeList(td, startTimeList, endTimeList). Table 2.20-42 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
td	pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
startTimeList	pointer to pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
endTimeList	pointer to pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h

Table 2.20-42 AssocAddToStartOfTimeList Information.

2.20.1.16.2 AssocAddToEndOfTimeList

AssocAddToEndOfTimeList adds the transaction td to the end of the TimeList. The routine makes sure that startTimeList points to the first transaction pointer on the TimeList and endTimeList points to the last transaction pointer on the TimeList. The function call is AssocAddToEndOfTimeList(td, startTimeList, endTimeList). Table 2.20-43 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
td	pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
startTimeList	pointer to pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
endTimeList	pointer to pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h

Table 2.20-43 AssocAddToEndOfTimeList Information.

2.20.1.16.3 AssocDeleteFromTimeList

AssocDeleteFromTimeList deletes the transaction td from the TimeList. The routine makes sure that startTimeList points to the first transaction pointer on the TimeList, that endTimeList points to the last transaction pointer on the TimeList, and that the TimeList elements remain properly linked by the timerFront and timeRear pointers when td is removed from the list. The function call is AssocDeleteFromTimeList(td, startTimeList, endTimeList). Table 2.20-44 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
td	pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
startTimeList	pointer to pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
endTimeList	pointer to pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h

Table 2.20-46 describes the variables used by strtok.c.

Variables		
Variable	Туре	Where Typedef Declared
tok_buf	array 512 of char	Standard C type.
tok_cp	pointer to char	Standard C type.

Table 2.20-46 strtok.c Variable Information.

2.20.1.17.1 strtok

strtok is a utility function used to parse strings. It performs the same functionality as the unix function strtok(). The function call is strtok(operand, set). Table 2.20-47 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
operand	pointer to char	Standard C type.
set	pointer to char	Standard C type.
	Internal Variable	
Variable	Туре	Where Typedef Declared
ret_val	pointer to char	Standard C type.
	Return Values	
Return Value	Туре	Meaning
0	pointer to char	the string was empty
ret_val	pointer to char	the parsed string
	Called By	
Function	Where Described	
AssocReadParams	Section 2.20.1.22.2.	

Table 2.20-47 strtok Information.

2.20.1.18 respondent.c

/simnet/libsrc/libassoc/respondent.c

respondent.c contains routines to implement the portion of the transaction protocol where this host is the respondent. Each element of responseMap is a pointer to a list or "bucket" of response descriptors. The transaction IDs of all transactions in a bucket have low order 7 bits that correspond to the map index, meaning that the low order 7 bits can be used to index the appropriate bucket.

2.20.1.18.1 AssocInitResponse

AssocInitResponse is called by AssocOpen to set up a response bucket map. The function call is AssocInitResponse(handle). Table 2.20-48 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
i	register int	Standard C type.
rd	register pointer to pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
channel	pointer to ChannelDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
	Called By	
Function	Where Described

AssocAttach	Section 2.20.1.5.2.	

Table 2.20-48 AssocInitResponse Information.

2.20.1.18.2 AssocCacheResponse

AssocCacheResponse is called by AssocSendResponse (Section 2.20.1.4.2) when a cached response is sent by the host. AssocSendResponse gets a descriptor for the response and fills in the pdubuf and length fields. AssoCacheResponse then links the response into the appropriate bucket for its transaction id and fills in any other descriptor-specific fields. The function call is AssocCacheResponse(handle, rd). Table 2.20-49 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type.
rd	pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
	Internal Variables	
Variable	Type	Where Typedef Declared

Function	Where Described	
AssocSendResponse	Section 2.20.1.4.2.	

Table 2.20-49 AssocCacheResponse Information.

2.20.1.18.3 AssocDeleteCachedResponse

AssocDeleteCachedResponse is called when a cached response times out. The response is removed from the time list, removed from the bucket list, and added to the free list. The parameter *rd* references the response transaction descriptor. The function call is AssocDeleteCachedResponse(handle, rd). Table 2.20-50 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type.
rd	pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
	Internal Variables	
Variable	Type	Where Typedef Declared

Function	Where Described	
AssocTimeOutOldResponses	Section 2.20.1.18.4.	

Table 2.20-50 AssocDeleteCachedResponse Information.

2.20.1.18.4 AssocTimeOutOldResponses

AssocTimeOutOldResponses goes through the time list and deletes all responses older than CacheTime. It is called either from AssocTickAssocLayer or when the FreeList is empty, in an attempt to free up some space. The function call is AssocTimeOutOldResponses(handle). Table 2.20-51 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
handle	int	Standard C type.

•	Internal Variables		
Variable	Туре	Where Typedef Declared	
t1	register pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h	
next	pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h

AssocProcessRequestPDU	Section 2.20.1.20.1.	

Table 2.20-52 AssocFindResponse Information.

2.20.1.19 proc_rsp.c /simnet/libsrc/libassoc/proc_rsp.c

proc_rsp.c contains a routine to process a response APDU.

2.20.1.19.1 AssocProcessResponsePDU

AssocProcessResponsePDU is called by AssocReceivePDU in order to process a response PDU. The routine first determines if the response was intended for the invoking process. If so, it determines which transaction was being responded to, invokes the call back routine, and deletes the transaction from the pending list. If the transaction cannot be found, the response is thrown away. If the response was not intended for the invoking process, it is treated as a datagram. The function call is AssocProcessResponsePDU(handle, apdu, data, length, group, protocol, primitive, originator, transID, respondent, rc). Table 2.20-53 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
handle	int	Standard C type.	
apdu	register pointer to	/simnet/common/include/prot	
	AssociationPDU	ocol/p_assoc.h	
data	pointer to pointer to char	Standard C type.	
length	pointer to long int	Standard C type.	
group	pointer to MulticastGroupID	/simnet/common/include/prot ocol/p_assoc.h	
protocol	pointer to	/simnet/common/include/prot	
	AssociationUserProtocol	ocol/p_assoc.h	
primitive	pointer to long int	Standard C type.	
originator	pointer to SimulationAddress	/simnet/common/include/prot ocol/address.h	
transID	pointer to TransactionIdentifier	/simnet/common/include/prot ocol/address.h	
respondent	pointer to SimulationAddress	/simnet/common/include/prot ocol/address.h	
rc	pointer to int	Standard C type.	
	Internal Variables		
Variable	Type	Where Typedef Declared

Table 2.20-54 AssocProcessResponsePDU Information.

2.20.1.20 proc_req.c

/simnet/libsrc/libassoc/proc_req.c

proc_req.c contains a routine to process a request APDU.

2.20.1.20.1 AssocProcessRequestPDU

AssocProcessRequestPDU is called by AssocReceivePDU in order to process a request PDU. The routine first determines if the request was intended for the invoking process. If so, it determines whether a response is cached for the request. If no response is cached, the request is passed to the host for processing. If a response is cached, it is retransmitted. If the request was not intended for the invoking process, it is treated as a datagram. The function call is AssocProcessRequestPDU(handle, apdu, data, length, group, protocol, primitive, originator, transID, respondent, rc). Table 2.20-55 describes the parameters used, errors returned and functions called using this function.

	Parameters		
Parameter	Туре	Where Typedef Declared	
handle	int	Standard C type.	
apdu	register pointer to AssociationPDU	/simnet/common/include/prot ocol/p_assoc.h	
data	pointer to pointer to char	Standard C type.	
length	pointer to long int	Standard C type.	
group	pointer to MulticastGroupID	/simnet/common/include/prot ocol/p_assoc.h	
protocol	pointer to AssociationUserProtocol	/simnet/common/include/prot ocol/p_assoc.h	
primitive	pointer to long int	Standard C type.	
originator	pointer to SimulationAddress	/simnet/common/include/prot ocol/address.h	
transID	pointer to TransactionIdentifier	/simnet/common/include/prot ocol/address.h	
respondent	pointer to SimulationAddress	/simnet/common/include/prot ocol/address.h	
rc	pointer to int	Standard C type.	
Verleble	Internal Variables	Where Turnedet Declared	
Variable	Type	Where Typedef Declared	
rd	register pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h

Table 2.20-55 AssocProcessRequestPDU Information.

2.20.1.21 proc_dgram.c /simnet/libsrc/libassoc/proc_dgram.c

proc_dgram.c contains a routine for processing datagrams.

2.20.1.21.1 AssocProcessDatagramPDU

AssocProcessDatagramPDU is used to process datagrams, however, is not called with the version 6.6 code; the macro PROCESS_DATAGRAM_PDU is called instead.

Parameters		
Parameter	Туре	Where Typedef Declared
apdu	register pointer to AssociationPDU	/simnet/common/include/prot ocol/p_assoc.h
data	pointer to pointer to char	Standard C type.
length	pointer to long int	Standard C type.
group	pointer to MulticastGroupID	/simnet/common/include/prot ocol/p_assoc.h
protocol	pointer to AssociationUserProtocol	/simnet/common/include/prot ocol/p_assoc.h
primitive	pointer to long int	Standard C type.
originator	pointer to SimulationAddress	/simnet/common/include/prot ocol/address.h

Table 2.20-56 AssocProcessDatagramPDU Information.

2.20.1.22 params.c

/simnet/libsrc/libassoc/params.c

params.c contains routines to get the association layer parameters for one channel from an "assoc.def" file. Table 2.20-57 describes the variables used by params.c.

Variables		
Variable	Type	Where Typedef Declared
params	array numParams of PARAM	/simnet/libsrc/libassoc/params. c
families	array MAX_FAMILIES of struct families	/simnet/libsrc/libassoc/params. c

Table 2.20-57 params.c Variable Information.

2.20.1.22.1 upshift

upshift converts tokens from assoc.def to upper case. The function call is upshift(str). Table 2.20-58 describes the parameters used by this function.

	Parameters	
Parameter	Type	Where Typedef Declared
str	pointer to char	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
ср	register pointer to char	Standard C type.
	Return Values

2.20.1.22.2 AssocReadParams

AssocReadParams is called to read in the ASCII parameter file, assocDef. The function call is AssocReadParams(handle, assocDef). Table 2.20-59 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
handle	int	Standard C type.
assocDef	pointer to char	Standard C type.

·	Internal Variables	
Variable	Туре	Where Typedef Declared
def	pointer to FILE	Standard C type.
buf	array ASSOC_PARM_MAX_LINE_ 1 of char	Standard C type.
tokPtr	pointer to char	Standard C type.
channel	pointer to ChannelDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
Р	register pointer to PARAM	/simnet/libsrc/libassoc/params.
	register int	Standard C type.
	Return Values	
Return Value	Туре	Meaning
-1	int	Unsuccessful.
0	int	Successful.

2.20.1.22.3 **ProcessSite**

ProcessSite processes the site parameter (read from the assocDef file) for the channel described by *channel*. The function call is ProcessSite(channel, tokPtr). Table 2.20-60 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
channel	pointer to ChannelDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
tokPtr	pointer to char	Standard C type.
<u>-</u>	Internal Verlables	
	Internal Variables	
Variable	Type	Where Typedef Declared
site	int	Standard C type.

Return Values		
Return Value	Type	Meaning
-1	int	Unsuccessful.
0	int	Successful.

Table 2.20-60 ProcessSite Information.

2.20.1.22.4 ProcessHost

ProcessHost processes the host parameter (read from the assocDef file) for the channel described by *channel*. The function call is ProcessHost(channel, tokPtr). Table 2.20-61 describes the parameters used by this function.

	Parameters		
Parameter	Туре	Where Typedef Declared	
channel	pointer to ChannelDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h	
tokPtr	pointer to char	Standard C type.	
	Internal Variables		
Variable	Type	Where Typedef Declared	
host	int	Standard C type.	
	Return Values		
Return Value	Туре	Meaning	
-1	int	Unsuccessful.	
0	int	Successful.	

Table 2.20-61 ProcessHost Information.

2.20.1.22.5 ProcessMaxSubscriptions

ProcessMaxSubscriptions processes the maxSubscriptions parameter (read from the assocDef file) for the channel described by *channel*. The function call is ProcessMaxSubscriptions(channel, tokPtr). Table 2.20-62 describes the parameters used by this function.

	Parameters	
Parameter	Type	Where Typedef Declared
channel	pointer to ChannelDescriptor	/simnet/libsrc/libassoc/assoc_1 cl.h
tokPtr	pointer to char	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
subscriptions	int	Standard C type
	Return Values	
Return Value	Туре	Meaning
-1	int	Unsuccessful.
0	int	Successful.

Table 2.20-62 ProcessMaxSubscriptions Information

2.20.1.22.6 ProcessInitDescriptors

ProcessInitDescriptors processes the initDescriptors parameter (read from the assocDef file) for the channel described by *channel*. The function call is ProcessInitDescriptors(channel, tokPtr). Table 2.20-63 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
channel	pointer to ChannelDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
tokPtr	pointer to char	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
initDescriptors	int	Standard C type.
	Return Values	
Return Value	Туре	Meaning
-1	int	Unsuccessful.
0	int	Successful.

Table 2.20-63 ProcessInitDescriptors Information.

2.20.1.22.7 ProcessAddlDescriptors

ProcessAddlDescriptors processes the addlDescriptors parameter (read from the assocDef file) for the channel described by *channel*. The function call is ProcessAddlDescriptors(channel, tokPtr). Table 2.20-64 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
channel	pointer to ChannelDescriptor	/simnet/libsrc/libassoc/assoc_l
tokPtr	pointer to char	Standard C type.
Variable	Internal Variables Type	Where Typedef Declared
	Internal Variables	
addiDescriptors	int	Standard C type.
	Return Values	
Return Value	Туре	Meaning
-1	int	Unsuccessful.
0	int	Successful.

Table 2.20-64 ProcessAddlDescriptors Information.

2.20.1.22.8 ProcessProtocolFamily

ProcessProtocolFamily processes the family parameter (read from the assocDef file) for the channel described by *channel*. The function call is ProcessProtocolFamily(channel, tokPtr). Table 2.20-65 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
channel	pointer to ChannelDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
tokPtr	pointer to char	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
i	register int	Standard C type.
	Return Values	
Return Value	Туре	Meaning
-1	int	Unsuccessful.
0	int	Successful.
	Calls	_
Function	Where Described	
upshift	Section 2.20.1.22.1.	

Table 2.20-65 ProcessProtocolFamily Information.

2.20.1.23 origin.c

/simnet/libsrc/libassoc/origin.c

origin.c contains routines to implement that portion of the transaction protocol where this host is the originator.

2.20.1.23.1 AssocInitTransactions

AssocInitTransactions is called by AssocOpen to set up a transaction bucket map. The function call is AssocInitTransactions(handle). Table 2.20-66 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
i	register int	Standard C type.
td	register pointer to pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
channel	register pointer to ChannelDescriptor	/simnet/libsrc/libassoc/assoc_lcl.h

Function	Where Described	
AssocOpen	Section 2.20.1.5.1.	
AssocAttach	Section 2.20.1.5.2.	

Table 2.20-66 AssocInitTransactions Information.

2.20.1.23.2 AssocAddTransaction

AssocAddTransaction is called when the host sends a transaction. It is placed at the head of the appropriate transaction bucket, and put at the end of the timeList.

AssocAddTransaction assumes that the transaction descriptor, td, already has the PDU copied in. The function call is AssocAddTransaction(handle, td, callback, cparam, timeout, tparam). Table 2.20-67 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type.
td	register pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
(callback)()	pointer to function returning int	Standard C type.
cparam	pointer to long int	Standard C type.
(timeout)()	pointer to function returning int	Standard C type.
tparam	pointer to long int	Standard C type.
	Internal Variables	
W		
Variable	Туре	Where Typedef Declared

Table 2.20-70 AssocRescheduleTransaction Information.

2.20.1.24 free_list.c /simnet/libsrc/libassoc/free_list.c

free_list.c contains routines to manage the free list of transaction descriptors. The free list is created as a stack at intialization time, to avoid calling malloc() or free() each time a descriptor is needed.

2.20.1.24.1 AssocCreateFreeList

AssocCreateFreeList creates the free list by allocating enough space for a certain number of descriptors (ASSOC_INITIAL_DESCRIPTORS + an extra char). The function call is AssocCreateFreeList(handle). Table 2.20-71 describes the parameters used and errors returned using this function.

	Paramet	£1.2
Parameter	Type	Where Typedef Declared
handle	int	Standard C type.

	Internal Variables	
Variable	Туре	Where Typedef Declared
i	register int	Standard C type.
td	register pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
channel	register pointer to ChannelDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
	Return Values	
Return Value	Туре	Meaning
-1	int	Didn't have enough memory to create list.
0	int	Successful.
	Errors	
Error Name	Reason for Error	
ANOMEMORY	Not enough memory for int	ernal Association structures.
	Called By	
Function	Where Described

Function	Where Described	
AssocGetDescriptor	Section 2.20.1.24.3.	

Table 2.20-72 AssocGrowFreeList Information.

2.20.1.24.3 AssocGetDescriptor

AssocGetDescriptor attempts to pop a node off the stack. If the stack has some nodes, the descriptor is returned. If you are at the bottom of the free list, the routine first tries to free nodes from the response list by calling AssocTimeOutOldResponses. If AssocTimeOutOldResponses is unsuccessful in freeing up a node, AssocGrowFreeList is called. If AssocGrowFreeList is unsuccessful, Null is returned. The function call is AssocGetDescriptor(handle). Table 2.20-73 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
handle	int	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
td	register pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
channel	register pointer to ChannelDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
	Return Values

Table 2.20-74 AssocFreeDescriptor Information.

2.20.1.25 bucket.c

/simnet/libsrc/libassoc/bucket.c

bucket.c contains routines to maintain bucket lists of pending transactions. Transactions are sorted into buckets by the low order 7 bits of their transaction ID, resulting in the possibility of each bucket having a linked list of transactions.

2.20.1.25.1 AssocAddToBucket

AssocAddToBucket adds a transaction to a bucket, linking it to any other transactions already in the bucket. The function call is AssocAddToBucket(td, map, mask). Table 2.20-75 describes the parameters used by this function.

	Parameters	
Parameter	Type	Where Typedef Declared
td	pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
map	pointer to pointer to AssocTransDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h
mask	int	Standard C type.

AssocFindResponse	Section 2.20.1.18.5.	
AssocFindTransaction	Section 2.20.1.23.4.	

Table 2.20-77 AssocBucketLookup Information.

2.20.1.26 assoc.h

/simnet/libsrc/libassoc/assoc.h

assoc.h contains all the definitions needed by the outside world to use the association layer library. Table 2.20-78 describes the variables used by assoc.h.

	Variables	
Variable	Type	Where Typedef Declared
assoc_errno	extern int	Standard C type.

Table 2.20-78 assoc.h Variable Information.

2.20.1.27 assoc_lcl.h

/simnet/libsrc/libassoc/assoc_lcl.h

assoc_lcl.h contains all the definitions that should be global throughout the association layer library but hidden from the outside world. Table 2.20-79 describes the variables used by assoc_lcl.h.

Variables		
Variable	Type	Where Typedef Declared
assocPaddingPDU	extern AssociationPDU	/simnet/common/include/prot ocol/p_assoc.h
channelMap	extern pointer to array maxChannels of ChannelDescriptor	/simnet/libsrc/libassoc/assoc_l cl.h

Table 2.20-79 assoc_lcl.h Variable Information.

2.20.1.28 defaults.h

/simnet/libsrc/libassoc/defaults.h

defaults.h contains the default values for the assoc.def file.

2.20.1.29 AssocDef

Assoc.def is a generic term for association layer parameter files. Any number of parameter files may exist. The assocDef parameter to the AssocOpen call is a pointer to the name of the parameter file to use for that channel. Thus, channel defaults are set independently by using different parameter files. There are six parameters which can be set for each association channel. They are described in Table 2.20-80.

Parameter	Description
SITE	Site id used for originator site/host pair. Default is site/melevant (see /simnet/common/include/protocol/address.h).
HOST	Host id used for originator site/host pair. Default is host/relevant (see /simnet/common/include/protocol/address.h).
MAX_SUBSCRIPTIONS	Maximum number of multicast addresses to which this channel may subscribe. Each potential subscription costs 8 bytes. Default is 64.
INITIAL_DESCRIPTORS	The number of descriptors allocated for transactions and cached responses at start-up. If this number is exhausted, more are allocated. Each descriptor costs 2628 bytes. Default is 20.
ADDITIONAL_DESCRIPTORS	The number of descriptors allocated additionally each time the current number of descriptors is exhausted. The default is 10.
PROTOCOL_FAMILY	The protocol family to which this channel will listen. The default is ASSOC_FAMILY_SIMNET. This parameter is specified symbolically as one of ASSOC_FAMILY_SIMNET, ASSOC_FAMILY_DATA, ASSOC_FAMILY_VOICE and ASSOC_FAMILY_GT.

Table 2.20-80 Assoc.def Parameters.

Parameters are specified, one per line, as <parameter> <parameter value>. Blank lines, spaces, tabs, etc. are ignored (except that <parameter> and <parameter value> must be separated by one or more blanks or tabs)> Line beginning with '#' are comments. The parameter reading mechanism is case insensitive.

Here is an example:

#This association definition file describes the defaults:

SITE	0
HOST	0
MAX_SUBSCRIPTIONS	64
INITIAL_DESCRIPTORS	20
ADDITIONAL_DESCRIPTORS	10
PROTOCOL_FAMILY	ASSOC_FAMILY_SIMNET

2.20.2 libnetif

Libnetif provides a high performance pathway to an unreliable datagram transport service such as that provided by an IEEE 802.3 network. Libnetif also provides several miscellaneous functions for controlling the network adapter unit. The miscellaneous functions allow applications to take advantage of adapter specific capabilities such as multicast addressing, high granularity timers, and intelligent on-board processors.

2.20.2.1 net ctl.c

/simnet/libsrc/libnetif/net_ctl.c

net_clt.c contains routines used to perform control functions on the network interface.

2.20.2.1.1 net_alive

net_alive probes the network interface referenced by the descriptor, h, to determine whether it is alive. Success means that the code loaded onto the network card is running. Failure means that the code has died and is not running. The function call is net_alive(h). Table 2.20-81 describes the parameters used, return values and possible errors generated by using this function.

	Paramete	ers
Parameter	Туре	Where Typedef Declared
h	int	Standard C type.
	-	
	Return Val	ues
Return Value	Туре	Meaning
-1	int	network interface doesn't respond, errno set to indicate error
0	int	successful
	Errors	
Error Name	Reason for Error	
EBADF	Not a valid descriptor.

net_access	Section 2.20.2.20.1.	

Table 2.20-82 net_res Information.

2.20.2.1.3 net settimeout

net_settimeout is called to specify a timeout of value seconds for net_recvs and net_sends to the network interface specified by h. The default condition is no timeout. A timeout value of 0 will cause no timeout. The function call is net_settimeout(h, value). Table 2.20-83 describes the parameters used, return values and possible errors generated by using this function.

	Paramete	ers
Parameter	Туре	Where Typedef Declared
h	int	Standard C type.
value	int	Standard C type.
	Return Va	lues
Return Value	Туре	Meaning
-1	int	operation failed, errno set to indicate error
0	int	successful
	Errors	
Error Name	Reason for Error	
EBADF	Not a valid descriptor.

Function	Where Described
CHECK_HANDLE	Macro defined in /simnet/libsrc/libnetif/libnet.h.

Table 2.20-83 net settimeout Information.

2.20.2.1.4 net_iocontrol

net_iocontrol provides a mechanism to access control functions provided by underlying network interface. It arranges for *sendsize* bytes to be copied to the network interface from buffer *sendbuf* and then for *recvsize* bytes to be copied to buffer *recvbuf* from the network interface. The contents of the buffers are I/O control function specific. The function call is net_iocontrol(h, sendbuf, sendsize, recvbuf, recvsize). Table 2.20-84 describes the parameters used, errors returned and functions called using this function with a Butterfly. Table 2.20-85 describes the parameters used, errors returned and functions called using this function with any other computer.

	Parameters	
Parameter	Туре	Where Typedef Declared
h	int	Standard C type.
sendbuf	pointer to char	Standard C type.
sendsize	int	Standard C type.
recybuf	pointer to char	Standard C type.
recvsize	int	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
np	register pointer to struct netlib_pb	/simnet/libsrc/libnetif/libnet.h
ret	int	Standard C type.
rbuf	pointer to char	Standard C type.
rbufoid	OID	
sbuf	pointer to char	Standard C type.

Function	Where Described	
CHECK_HANDLE	Macro defined in /simnet/libsrc/libnetif/libnet.h.	

Table 2.20-86 net_nopened Information.

2.20.2.1.6 net_loopback

net_loopback turns the loopback of packets on and off. If flag is 1, packets are looped. If flag is 0, they are not looped. The default condition after initialization is that packets are not looped. arg is only used if SIMBFLY is NOT defined. The function call is net_loopback(h, flag). Table 2.20-87 describes the parameters used and functions called using this function.

	Parameters		
Parameter	Туре	Where Typedef Declared	
h	int	Standard C type.	
flag	int	Standard C type.	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
np	register pointer to struct netlib_pb	/simnet/libsrc/libnetif/libnet.h

2.20.2.2 net addr.c

/simnet/libsrc/libnetif/net_addr.c

2.20.2.2.1 net_addr_compare

net_addr_compare is an address manipulation routine. It compares the two NetworkAddresses al and a2 and returns an indication of whether thay are equal or not. The function call is net_addr_compare(a1, a2). Table 2.20-88 describes the parameters used and return values generated by using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
a1	pointer to NetworkAddress	/simnet/libsrc/libnetif/network.
a2	pointer to NetworkAddress	/simnet/libsrc/libnetif/network.
	Internal Variables	
Variable	Type	Where Typedef Declared
	int	Standard C type.
	Return Values	
Return Value	Туре	Meaning
FALSE	int	NetworkAddressess are not equal.
TRUE	int	NetworkAddresses are equal.

Table 2.20-88 net_addr_compare Information.

2.20.2.2.2 net_addr_bin_to_str

net_addr_bin_to_str converts the NetworkAddress p into a null terminated string which is returned to s. s must point to a buffer at least 13 bytes long to accommodate the string generated by net_addr_bin_to_str. The routine always succeeds so there is no return value. The function call is net_addr_bin_to_str(p, s). Table 2.20-89 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
p	pointer to NetworkAddress	/simnet/libsrc/libnetif/network.
S	pointer to char	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
i	int	Standard C type.
j	int	Standard C type.

Table 2.20-89 net_addr_bin_to_str Information.

2.20.2.2.3 net_addr_str_to_bin

net_addr_str_to_bin converts the string s into a NetworkAddress in p. The function call is net_addr_bin_to_str(p, s). Table 2.20-90 describes the parameters used and return values generated by using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
р	pointer to NetworkAddress	/simnet/libsrc/libnetif/network.
S	pointer to char	Standard C type.
	pointer to char	Claridard Citype.

	Internal Var	lables
Variable	Type	Where Typedef Declared
	int	Standard C type.
Χ	int	Standard C type.
Return Values		
Return Value	Type	Meaning
FALSE	int	String address did not have exactly 12 hex digits. Address is all 0s.
TRUE	int	String address had exactly 12 hex digits.

Table 2.20-90 net_addr_str_to_bin Information.

2.20.2.2.4 net_getaddr

net_getaddr gets the network address of the interface specified by the descriptor h to the NetworkAddress p. It returns an indication of success or failure. The function call is net_getaddr(h, p). Table 2.20-91 describes the parameters used, return values and possible errors generated by using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
h	int	Standard C type.
р	pointer to NetworkAddress	/simnet/libsrc/libnetif/network.
	Beturn Voluce	
Datam Matus	Return Values	
Return Value	Туре	Meaning
-1	int	Operation failed, errno set to indicate error.
0	int	Successful.
	Errors	<u> </u>
Error Name	Reason for Error	
EBADF	Not a valid descriptor.	
EIO	The network interface did not respond.

2.20.2.3 net clos.c

/simnet/libsrc/libnetif/net_clos.c

2.20.2.3.1 net_close

net_close closes the access to the network interface specified by descriptor h. It should be called prior to exiting. The function call is net_close(h). Table 2.20-94 describes the parameters used, return values and possible errors generated by using this function with a Butterfly. Table 2.20-95 describes the parameters used, return values and possible errors generated by using this function with a MassComp. Table 2.20-96 describes the parameters used, return values and possible errors generated by using this function with a Sun or a MIPS.

2.20.2.4 net_flus.c /simnet/libsrc/libnetif/net_flus.c

2.20.2.4.1 net_flush

net_flush flushes all packets from the receive and/or transmit queues for the network interface specified by descriptor h. The card must be running (reference net_norm in Section 2.20.2.7.1) before this call can be made. flags is a bit mask that selects whether the receive queue (NETFLUSHRCV) or the transmit queue (NETFLUSHXMT) or both (NETFLUSHRCV | NETFLUSHXMT) are flushed. An indication of success or failure is returned. The calls to Wait_DualQ() and Unlock_DualQ() are only made if SIMBFLY is defined. The function call is net_flush(h, flags). Table 2.20-97 describes the parameters used, return values and possible errors generated by using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
h	int	Standard C type.
flags	int	Standard C type.
	Internal Variables

2.20.2.5 net_stat.c /simnet/libsrc/libnetif/net_stat.c

2.20.2.5.1 net_get_statistics

net_get_statistics gets the accumlated statistics from the network interface specified by descriptor h to the array stats. The following statistics are returned:

successful transmissions multiple retries reported single retries reported retry failure reported (check cable) deferrals reported buffer errors silo underruns late collisions (check cable) carrier losses (check cable) babbling transmitter errors collisions errors memory errors packets received missed packet reported CRC errors reported (check cable) framing errors (check cable) silo overruns stp bit missing enp bit missing lance errors non-SIMNET packets

The "check cable" annotation indicates a potential cable fault if the associated statistic is increasing. The function call is net_get_statistics(h, stats). The variable arg is only used if MIPS is defined. Table 2.20-98 describes the parameters used, return values and possible errors generated by using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
h	int	Standard C type.
stats	pointer to long	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
arg	struct enpaccess_arg	enparg.h

2.20.2.6 net_info.c /simnet/libsrc/libnetif/net_info.c

2.20.2.6.1 net hostbuf info

net_hostbuf_info obtains a pointer to and the size in bytes of the hostbuf. The pointer is returned in *pbufptr* and the size is returned in *pbufsize*. This memory block is guaranteed to be aligned on a short boundary. The hostbuf is a segment of memory resident on the network card that is accessible to an application running on the host as well as to code running on the network card. It may be used to transfer parameters between an application and filtering code, for example, running on the network card. The host should avoid heavy access to this region as it will consume bus bandwidth on the network card. The function call is net_hostbuf_info(h, pbufptr, pbufsize). Table 2.20-102 describes the parameters used, return values and possible errors generated by using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
h	int	Standard C type.
pbufptr	pointer to pointer to char	Standard C type.
pbufsize	pointer to int	Standard C type.

Table 2.20-102 net hostbuf info Information.

2.20.2.6.2 net_sharebuf_info

net_sharebuf_info is called to obtain a pointer to and the size in bytes of the shared buffer, which is a segment of memory resident in the host that the network card and an application running on the host can access. The pointer is returned into *pbufptr* and the size in *pbufsize*. This memory segment is guaranteed to be aligned on a long boundary. The function call is net_sharebuf_info(h, pbufptr, pbufsize). Table 2.20-103 describes the parameters used, return values and possible errors generated by using this function.

	Parameters

Table 2.20-103 net_sharebuf_info Information.

2.20.2.6.3 net_bufs

net_bufs returns the number of transmit and receive buffers available in the underlying network interface. pxmtbus and prcvbufs are pointers to where to return the number of transmit and receive buffers. The function call is net_bufs(h, pxmtbufs, prcvbufs). Table 2.20-104 describes the parameters used and functions called using this function.

	Parameters	3
Parameter	Type	Where Typedef Declared
h	int	Standard C type.
pxmtbufs	pointer to int	Standard C type.
prcvbufs	pointer to int	Standard C type.
	Internal Variat	oles
Variable	Туре	Where Typedef Declared

Table 2.20-106 net syserror info Information.

2.20.2.6.6 net version

net_version returns a null terminated string that contains the version of the underlying network interface software. version is a pointer to the buffer into which the version string is returned. version_size is the size of the buffer pointed to by version. The function call is net_version(h, version, version_size). Table 2.20-107 describes the parameters used, and functions called using this function with a Butterfly. Table 2.20-108 describes the parameters used and functions called using this function with all other computers.

	Parameters	
Parameter	Туре	Where Typedef Declared

2.20.2.7 net_mode.c /simnet/libsrc/libnetif/net_mode.c

2.20.2.7.1 net_norm

net_norm starts the network interface specified by descriptor h in the normal mode of operation. The ethernet address of the interface is set to na upon the first invocation of the call. The argument na must be a valid pointer for subsequent calls by the data will be ignored. The function call is net_norm(h, na). Table 2.20-109 describes the parameters used, return values and possible errors generated by using this function.

Parameters		
Parameter	Type	Where Typedef Declared
h	int	Standard C type.
na	pointer to NetworkAddress	/simnet/libsrc/libnetif/network.

Return Values

Table 2.20-112 net prom Information.

2.20.2.7.5 do_mode_cmd

do_mode_cmd is an internal library function for setting the mode of the underlying network interface. *mode* is a mode word (one of NORMMODE, EXTLMODE, INTLMODE, PROMMODE - normal, external loopback, internal loopback and promiscuous modes, respectively), h is a descriptor, na is a pointer to the network address to which the Ethernet address of the network interface is set. The function call is do_mode_cmd(mode, h, na). Table 2.20-113 describes the parameters used, errors returned and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
mode	int	Standard C type.
h_	int	Standard C type.
na	pointer to NetworkAddress	/simnet/libsrc/libnetif/network. h
	Internal Variables

2.20.2.8 net time.c

/simnet/libsrc/libnetif/net_time.c

net_time.c contains routines to access the CMC card timer.

2.20.2.8.1 net_gettime

net_gettime obtains the current value of the 31 bit timer maintained by the network interface specified by descriptor h. The timer is incremented every 998.26 microseconds. The function call is net_gettime(h). Table 2.20-116 describes the parameters used, return values and possible errors generated by using this function.

	Paramete	ers

net_access	Section 2.20.2.20.1.	

Table 2.20-117 net_settime Information.

2.20.2.8.3 net current_time

net_current_time returns the number of ticks since the last call to net_init_time (Section 2.20.2.8.4). net_init_time must be called once before net_current_time will return a meaningful value. If it is not called for a bit over 60 seconds, it loses track of time, as the 16-bit timer cycles. While this is not a fatal error, the time returned by net_current_time will not be correct. The function call is net_current_time(h). Table 2.20-118 describes the parameters used, return values and possible errors generated by using this function.

	Parameto	ers
Parameter	Type	Where Typedef Declared

2.20.2.8.5 net_stomp_time

net_stomp_time directs the network interface to set the 32 bit timer to the timestamp value of the next packet (if any) in the transmit queue. This call has no effect if timestamping is not enabled. It is useful as a "fast forward" function in applications that need to replay timestamped packets. The function call is net_stomp_time(h). Table 2.20-120 describes the parameters used, return values and possible errors generated by using this function.

	Paramete	rs
Parameter	Type	Where Typedef Declared
<u>h</u>	int	Standard C type.

2.20.2.10 net_open.c /simnet/libsrc/libnetif/net open.c

2.20.2.10.1 net open

net_open opens an access path to the network interface. path specifies the network interface to open. flags specifies options to be active for subsequent accesses to the network interface. Currently, the only flag defined is NETINIT, which should be used only by ringstart. Otherwise, flags should be 0. The third parameter is only necessary if NETINIT is set. The net_info_block contains default information for the rings and is used only during system intialization by the network daemon. This routine will test to determine whether the network interface card is alive and will fail if it does not respond. The function call is net_open(path, flags, nib). Table 2.20-133 describes the parameters used, return values and possible errors generated by using this function with a Butterfly. Table 2.20-134 describes the parameters used, return values and possible errors generated by using this function with any other computer.

2.20.2.10.2 net_get_parameters

net_get_parameters gets the current network parameters. These include such things as the number of ring elements and size of ring elements, and various memory keys. If the flag is FALSE, the parameters are taken from the process's information block. If the flag is TRUE, the parameters are obtained from the driver directly. Normally, these should be identical, but they may not be if net_open (Section 2.20.2.10.1) was called with the NETINIT flag. The function call is net_get_parameterss(h, nib, flag). Table 2.20-135 describes the parameters used, return values and possible errors generated by using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared

Table 2.20-135 net_get_parameters Information.

2.20.2.10.3 net_set_parameterss

net_set_parameters copies the passed parameter block to the driver (flag is TRUE) or the per-process parameter block (flag is FALSE). net_set_parameters will rarely be used except in ringstart. The function call is net_set_parameters(h, nib, flag). Table 2.20-136 describes the parameters used, return values and possible errors generated by using this function.

Parameters

2.20.2.10.4 open_cmc

open_cmc is the open handler for the cmc card. It is an internal library function. device and flags are the same as for net_open. nib is a pointer to a network interface block; h is a descriptor; np is a pointer to a data structure that is internal to the library and controls the access. The function call is open_cmc(device, flags, nib, h, np). Table 2.20-137 describes the parameters used and functions called using this function.

2.20.2.10.6 get_type

get_type is an internal library function that gets the type of the network interface, whether cmc (NIF_TYPE_CMC) or MVME147 (NIF_TYPE_147). np is a pointer to the control structure for the access; dev is a pointer to the device name; flags are the flags passed to net_open. net_access() is only called if SIMBFLY is defined. The function call is get_type(np,dev,flags). Table 2.20-139 describes the parameters used and functions called using this function.

	Parameters

2.20.2.11 net_mca.c /simnet/libsrc/libnetif/net mca.c

net_mca.c contains routines to control multicast addressing.

2.20.2.11.1 net_add_mca

net_add_mca adds a multicast address to the list of multicast addresses that the network interface is filtering on. The *pna* argument is a pointer to the multicast address. Up to the number of addresses specified in the network.def file (see network.def) may be passes to the network interface. The function call is net_add_mca(h, pna). Table 2.20-141 describes the parameters used, return values and possible errors generated by using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
h	int	Standard C type.

2.20.2.12.3 net get timestamp

net_get_timestamp gets the timestamp for the last packet received from the network interface specified by descriptor h. The value returned has meaning only if timestamping is enabled. Each received packet is timestamped (when enabled) with the number of ticks (where a tick is 998.26 microseconds) that have elapsed since the network interface was booted or the timer on the network interface was set until the packet was received. The function call is net_get_timestamp(h). Table 2.20-146 describes the parameters used, return values and possible errors generated by using this function.

	Paramet	ers
Parameter	Type	Where Typedef Declared

CHECK_HANDLE	Macro defined in /simnet/libsrc/libnetif/libnet.h.	

Table 2.20-146 net_get_timestamp Information.

2.20.2.12.4 net_put_timestamp

net_put_timestamp sets the timestamp value to *time* for the next packet to be transmitted on the network interface specified by descriptor h. The value is significant only if timestamping is enabled. The next packet will not actually be transmitted until the timer value of the timer on the network interface equals or is greater than the timestamp value set with net_set_timestamp. The function call is net_put_timestamp(h, time). Table 2.20-147 describes the parameters used, return values and possible errors generated by using this function.

2.20.2.13 net_run.c

/simnet/libsrc/libnetif/net_run.c

2.20.2.13.1 net_run

net_run causes the network interface to begin executing downloaded code. Initially, the processor is executing out of a rom-based kernel. The net_run call causes control to be transferred to the downloaded code from the rommed kernel on the network card. The processor then executes in an idle loop, waiting for a command to cause it to start executing either in normal mode (Section 2.20.2.7.1, net_norm), internal loopback mode (Section 2.20.2.7.3, net_extloop). Also Section 2.20.2.13.2, net_stop. The function call is net_run(h). Table 2.20-148 describes the parameters used, return values and possible errors generated by using this function.

Table 2.20-149 net stop Information.

2.20.2.14 net orecv.c

/simnet/libsrc/libnetif/net_orecv.c

net_orecv.c contains routines to perform data access functions.

2.20.2.14.1 net_recv

net_recv reads the next available packet from the network interface into buffer buf if hdr is NULL or copies the Ethernet header into hdr if hdr is non-NULL and places the data portion of the packet into buffer buf. In either case, the number of bytes placed in plen is obtained from the bufsize. Three flag bits may be specified in flags which affect how the write access will be performed. If NETLOCK is set, a semaphore is used to enforce exclusive access to the queue of packets. This allows multiple processes to read the packet queues without corrupting the data structures that control access by the network interface and host processes to the packet queues. If NETLOCK is not set, the semaphores are not examined or set and only one process is assumed to ever access the queues. If NETWAIT is set, the net_recv call will poll (spin) until a packet can be obtained from the queue. If

NETWAIT is not set, net_recv will return a TRUE indication if a packet was successfully received and a FALSE indication if not. Note that if both NETWAIT and NETLOCK are set, the process will sleep on the semaphore associated with the queue and the poll the queue until a packet is received. If NETBLOCK is set, the net_recv call will perform a blocking access of the appropriate packet queue. This is true blocking access, i.e., the calling process will sleep. The access will be exclusive, i.e., a semaphore will be used to control access. NETWAIT and NETLOCK may not be specified in conjunction with NETBLOCK. A timeout for blocking accesses may be specified via the net_settimeout call. The function call is net_recv(h, hdr, buf, bufsize, plen, flags). Table 2.20-150 describes the parameters used, return values and possible errors generated by using this function.

2.20.2.14.2 recv_cmc

recv_cmc is the receive handler for the cmc card. It is an internal library function. Arguments are the same as net_rcv, except for the addition of *np* which is a pointer to the access control structure. *blocking_args* and the call to net_access() are only used if SIMBFLY is NOT defined. The function call is recv_cmc(h, hdr, buf, bufsize, plen, flags, np). Table 2.20-151 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared

2.20.2.14.6 net_get_recv

net_get_recv gets a pointer to the header, hdr, and the data part, buf, of the next packet in the queue and also returns the number of bytes in the buffer, plen. It will not try to use NULL pointers passed as arguments. The function call is net_get_recv(h, hdr, buf, plen, flags). Table 2.20-155 describes the parameters used, errors returned and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
h	int	Standard C type.

Table 2.20-156 net_release_recv Information.

2.20.2.15 net_osend.c /simnet/libsrc/libnetif/net_osend.c

2.20.2.15.1 net_send

net_send writes the packet in buffer buf to the network interface if hdr is NULL or obtains the Ethernet header from hdr if hdr is non-NULL and the data portion of the packet from buffer buf. In either case, the number of bytes read from buf is obtained from the len argument. Three flag bits may be specified in flags which affect how the write access will be performed. If NETLOCK is set, a semaphore is used to enforce exclusive access to the queue of packets. This allows multiple processes to write the packet queues without corrupting the data structures that control access by the network interface and host processes to the packet queues. If NETLOCK is not set, the semaphores are not examined or set and only one process is assumed to ever access the queues. If NETWAIT is set, the net_send call will poll (spin) until a packet can be obtained from the queue. If NETWAIT is not set, net send will return a TRUE indication if a packet was successfully transmitted and a FALSE indication if not. Note that if both NETWAIT and NETLOCK are set, the process will sleep on the semaphore associated with the queue and poll the queue until a packet is received. If NETBLOCK is set, the net_send call will perform a blocking access of the appropriate packet queue. This is true blocking access, i.e., the calling process will sleep. The access will be exclusive, i.e., a semaphore will be used to control access. NETWAIT and NETLOCK may not be specified in conjunction with NETBLOCK. A timeout for blocking accesses may be specified via the net_settimeout call. The function call is net_send(h, hdr, buf, len, flags). Table 2.20-157 describes the parameters used, return values and possible errors generated by using this function.

2.20.2.16 net reg.c

/simnet/libsrc/libnetif/net_reg.c

net_reg.c contains routines to access the network interface registers.

2.20.2.16.1 net_reg_read

net_reg_read reads the value of the network interface register specified by regnum and returns the value into pval. The network interface registers are a block of NUMBER_OF_REGISTERS long words directly mapped into a process's segment for rapid access. The registers are available for communication with on-board packet filtering routines (see net_filter). The ENP30 implementation (Multibus) reads and writes a short (16 bits) at a time, so accesses are not necessarily atomic. The function call is net_reg_read(h, regnum, pval). Table 2.20-162 describes the parameters used, return values and possible errors generated by using this function.

2.20.2.17.7 recv_147_8023

recv_147_8023 is not supported for any computer currently used by SIMNET. The function call is recv_147_8023(h, buf, bufsize, plen, size, np). Table 2.20-170 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
h	int	Standard C type.
buf	pointer to char	Standard C type.
bufsize	int	Standard C type.
plen	pointer to int	Standard C type.
flags	int	Standard C type.
np	register pointer to struct netlib_pb	/simnet/libsrc/libnetif/libnet.h
	Return Values	
Return Value	Туре	Meaning
-1	int	Always returned.

2.20.2.17.9 net_get_rcv

net_get_rcv gets a pointer, buf, to the data part of the next packet in the queue and also returns the number of bytes in the buffer, plen. The function call is net_get_rcv(h, buf, plen, flags). Table 2.20-172 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
h	int	Standard C type.
buf	pointer to pointer to char	Standard C type.
plen	pointer to int	Standard C type.
flags	int	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
np	register pointer to struct netlib_pb	/simnet/libsrc/libnetif/libnet.h
тр	register pointer to QueueElement	/simnet/libsrc/libnetif/network.
ret	int	Standard C type.
size	int	Standard C type.
datap	pointer to char	Standard C type.
	Return Values	
Return Value	Туре	Meaning
ret	int	0 if successful -1 if not successful

2.20.2.18 net type.c

/simnet/libsrc/libnetif/net_type.c

net_type.c contains routines for ethernet type code checking.

2.20.2.18.1 net_add_type

net_add_type adds a type code to the list of types that the network interface is checking for. The function call is net_add_type(h, type). Table 2.20-174 describes the parameters used and functions called using this function while using a Butterfly. Table 2.20-175 describes the parameters used and functions called using this function with any other computer.

Parameters		
Parameter	Туре	Where Typedef Declared
h	int	Standard C type.

2.20.2.19.3 send_cmc_8023

send_cmc_8023 is the send handler for the cmc card for 802.3 packets. The parameters are the same as for net_snd except for the addition of *np* which is a pointer to the access control structure for the access. *blocking_args* and the call to net_access() are only used if the computer is not a Butterfly. The function call is send_cmc_8023(h, to, buf, len, flags, np). Table 2.20-179 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
h	int	Standard C type.
to	pointer to NetworkAddress	/simnet/libsrc/libnetif/network.

2.20.2.20.1 net_access

net_access is the common access routine to the network server. net_access is an internal library call. It returns the error code provided by the operating system the library is running on. h is the access handle and command is the command code to execute. The command specific arguments are assumed to be set up by the caller. The handle is assumed to be valid. The function call is net_access(h, command). Table 2.20-185 describes the parameters used and functions called using this function with a Butterfly computer. Table 2.20-186 describes the parameters used and functions called using this function with a Sun, MIPS, MSC or MassComp computer.

net_access	Section 2.20.2.20.1.	

Table 2.20-187 access_cmc Information.

2.20.2.20.3 access_147

access_147 is not supported by any computers used in SIMNET. This function will always return 0. The function call is access_147(np). Table 2.20-188 describes the parameters used by this function.

	Parameters	
Parameter	Type	Where Typedef Declared
пр	pointer to struct netlib_pb	/simnet/libsrc/libnetif/libnet.h
	Return Values	
Return Value	Type	Meaning
0	int	Always returned.
	Called By	· · · · · · · · · · · · · · · · · · ·
Function	Where Described	
net_access	Section 2.20.2.20.1.	

Table 2.20-188 access_147 Information.

2.20.2.21 net_stuf.c /simnet/libsrc/libnetif/net_stuf.c

None of the following functions are compiled if SIMBFLY is defined. Table 2.20-189 describes the variables used by net_stuf.c.

Variables		
Variable	Type	Where Typedef Declared
force_some_compilation	int	Standard C type.

Table 2.20-189 net stuf.c Variable Information.

2.20.2.21.1 get_locks

get_locks gets the locks for the rings. It does nothing and always returns 0 for Sun, MIPS and MSC computers. The function call is get_locks(np). Table 2.20-190 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
np	pointer to struct netlib_pb	/simnet/libsrc/libnetif/libnet.h
	Return Values	
Return Value	Туре	Meaning
-1	int	Unsuccessful.
0	int	Successful. Always returned for Sun, MIPS and MSC computers.
	Colled Du	
	Called By	
Function	Where Described	
open_cmc	Section 2.20.2.10.4.	

Table 2.20-190 get locks Information.

2.20.2.21.2 map_buffers

map_buffers maps in the buffers. On the MassComp it attaches the buffers, while on the Sun it just maps them in. The function call is map_buffers(np, flags). Table 2.20-191 describes the parameters used and functions called using this function with a MassComp computer. Table 2.20-192 describes the parameters used and functions called using this function with a MIPS machine. Table 2.20-193 describes the parameters used and functions called using this function with a Sun. Table 2.20-194 describes the parameters used by this function with an MSC.

Parameters		
Parameter	Туре	Where Typedef Declared
np	pointer to struct netlib_pb	/simnet/libsrc/libnetif/libnet.h
flags	int	Standard C type.

	Internal Variable	les
Variable	Туре	Where Typedef Declared
ptr	pointer to char	Standard C type.
	Return Values	§
Return Value	Type	Meaning
-1	int	Unsuccessful.
0	int	Successful.
<u>- </u>

Function	Where Described		
open_cmc	Section 2.20.2.10.4.		

Table 2.20-196 Sun, MIPS or MSC map_enp Information.

2.20.2.21.4 unmap_enp

unmap_enp frees up the memory allocated to map the timer. If the compuer is not a MassComp then nothing happens but 0 is still returned. The function call is unmap_enp(np). Table 2.20-197 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
np	pointer to struct netlib pb /simnet/libsrc/libnetif/libn		
	Return Values		
Return Value	Туре	Meaning	
0	int	Always returned.	

Table 2.20-197 unmap_enp Information.

2.20.2.21.5 unmap_buffers

unmap_buffers undoes the action of Section 2.20.2.21.2 map_buffers. The function call is unmap_buffers(np). Table 2.20-198 describes the parameters used, errors returned and functions called using this function when used on a Mascomp computer. Table 2.20-199 describes the parameters used, errors returned and functions called using this function on a Sun or a MIPS.

Parameters		
Parameter	Туре	Where Typedef Declared
np	pointer to struct netlib_pb	/simnet/libsrc/libnetif/libnet.h
	Return Values	
Return Value	Туре	Meaning
0	int	Always returned.

2.20.2.22 net_data.c

/simnet/libsrc/libnetif/net_data.c

Variables			
Variable	Туре	Where Typedef Declared	
statistics_strings[][41]	matrix of char	Standard C type.	
max statistics string	int	Standard C type.	
BroadcastAddress	NetworkAddress	/simnet/libsrc/libnetif/network.	
FillinAddress	NetworkAddress	/simnet/libsrc/libnetif/network.	
npb_space	array NUM_NETHANDLES of struct netlib_pb	/simnet/libsrc/libnetif/libnet.h	
npb	pointer to struct netlib_pb	/simnet/libsrc/libnetif/libnet.h	
enpmapsize	unsigned	/usr/include/sys/sem.h	
sem_unlock	struct sembuf	/usr/include/sys/sem.h	
sem_lock_wait	struct sembuf	/usr/include/sys/sem.h	
sem_lock_nowait	struct sembuf	/usr/include/sys/sem.h	

Table 2.20-201 net data.c Variable Information.

2.20.2.23 pktq.h

/simnet/libsrc/libnetif/pktq.h declares the structure of the elements of the queue of packets.

2.20.2.24 network.h

/simnet/libsrc/libnetif/network.h contains constants and declarations for using libnetif. This file contains the public interface to the library.

2.20.2.25 netlock.h

/simnet/libsrc/libnetif/netlock.h defines macros for locking and unlocking the incoming queue of packets.

2.20.2.26 libnet.h

/simnet/libsrc/libnetif/libnet.h is the private header file for libnetif. It declares and defines constants, macros, types, and includes for libnetif.

2.20.2.27 network.def

The network. def file specifies the configuration of the network interface. This file is read at boot time and each restart by the network daemon. Parameters are stored in the driver and obtained via library calls as needed. A change in network. def does not take effect until the network daemon is restarted. If the size of any memory segment is changed (such as the inring, outring, or sharebuf) the shared memory should be removed before restarting the network. An example network. def file is shown below:

```
# network definition file
# This file contains data that defines the configuration of
# the SIMNET network interface.
#

device enp0
address fffffffffff
inringkey 5
inringnum 32
outringkey 6
outringnum 4
sharekey 7
sharesize 4096
xmtsemkey 4
rcvsemkey 3
hostbufsize 0
multicast 64
```

The device entry specifies the network interface device in /dev.

The address entry specifies the ethernet address of the interface. Any multicast address (such as the broadcast address) directs the interface to use its ROMed address.

The inringkey entry specifies the shared memory key to use for the receive (input) ring.

The inringnum entry specifies the number of receive ring buffers.

The outringkey entry specifies the shared memory key to use for the transmit (output) ring.

The outringnum entry specifies the number of transmit ring buffers

The sharekey entry specifies the shared memory key to use for the shared memory buffer. This buffer resides in the host and is accessible to the application and the code running on the network card.

The sharesize entry is the number of bytes allocated to the shared buffer.

The xmtsemkey entry specifies the semaphore key used for the transmit ring lock.

The revsemkey entry specifies the semaphore key used for the receive ring lock.

The hostbufsize entry reserves a segment of on-card memory for host use. This is a count in bytes for the nuymber of bytes to reserve.

The multicast entry specifies the number of multicast addresses that the card can support.

2.21 The MCC Libraries

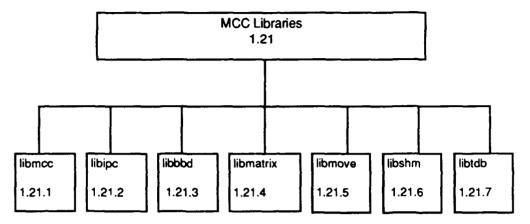

Figure 2.21-1: MCC Libraries.

2.21.1 libmcc

The MCC library (librace) provides access to many services shared among and throughout the MCC host processes. Abstract data types simulator tables, ccv status entries and supply truck tables directly support the MCC simulation. More basic ADT's such as fast, hash accessed queues, data type conversion routines and protocol interface routines provide flexible and efficient front ends to internal data structures.

2.21.1.1 atatp.c /simnet/mcc/libmcc/atatp.c

atatp.c implements an AppleTalk Transaction Protocol. The AppleTalk Transaction Protocol allows MCC host processes to send and receive AppleTalk messages to and from MCC Macintosh consoles. The protocol provides a reliable end-to-end datagram service between sender and receiver. A shared table is used to maintain state information on outstanding transactions. Table 2.21-1 describes the variables used by atatp.c.

Variables		
Variable	Туре	Where Typedef Declared
tid	short	Standard C type.
activeTransactions	pointer to array of Transaction	/simnet/mcc/include/bridge.h

Table 2.21-1 atatp.c Variable Information.

2.21.1.1.1 ATPSendRequest

ATPSendRequest sends an ATP Request packet. The function call is ATPSendRequest(t). The function is void so there are no errors or return values. Table 2.21-2 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
t .	register pointer to Transaction	/simnet/mcc/include/bridge.h
· · · · · · · · · · · · · · · · · · ·	Internal Variables	
Variable	Type	Where Typedef Declared

	Called By	
Function	Where Described	
ATPTimeout	See Section 2.21.1.1.3.	
ATPRequest	See Section 2.21.1.1.4.	

Table 2.21-2 ATPSendRequest Information.

2.21.1.1.2 ATPSendResponse

ATPSendResponse sends an ATP Response packet. The function call is ATPSendResponse(t). The function is void so there are no errors or return values. Table 2.21-3 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
t	register pointer to Transaction	/simnet/mcc/include/bridge.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
msg	MCCMessageBuffer	/simnet/mcc/include/MCC_ipc .h
	Calls	
Function	Where Described	
SendPacket	See Section 2.21.1.4.3.	
	Called By

ATPSendRequest	See Section 2.21.1.1.1.	
ATPResponse	See Section 2.21.1.1.6.	
ATReceive	See Section 2.21.1.1.7.	

Table 2.21-4 ATPTimeout Information.

2.21.1.1.4 ATPRequest

ATPRequest sends an ATP request. It places the transaction in the active transaction table, allocates a socket, constructs the ATP Request packet, sends the packet and starts a retry timeout alarm. The function call is ATPRequest(t, priority). Table 2.21-5 describes the parameters used, errors returned and functions called using this function.

Parameters	
Type	Where Typedef Declared
register pointer to Transaction	/simnet/mcc/include/bridge.h
int Standard C type.	
Internal Variables	
Type	Where Typedef Declared
register pointer to char	Standard C type.
int	Standard C type.
Errors	
The active transaction table is full.	
	Type register pointer to Transaction int Internal Variables Type register pointer to char int Errors Reason for Error

Calls

Table 2.21-7 ATPResponse Information.

2.21.1.1.7 ATReceive

ATReceive processes a packet received from the AppleTalk network. This routine is called when a YUMM message bearing a DDP packet arrives from the Appletalk Network. The function call is ATReceive(type, kind, length, data, reqID). Table 2.21-8 describes the parameters used, errors returned and functions called using this function.

	Parameters	:
Parameter	Туре	Where Typedef Declared
type	int	Standard C type.
length	int	Standard C type.
kind	long	Standard C type.
regID	long	Standard C type.
data	register pointer to char	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
bp	register pointer to char	Standard C type.
t	register pointer to Transaction	/simnet/mcc/include/bridge.h
alarmsEnabled	int	Standard C type.
ccField	short	Standard C type.
seqField	short	Standard C type.
tidField	short	Standard C type.
i	short	Standard C type.
data	register pointer to char	Standard C type.
	Errors	
Error Name	Reason for Error	
MCC_UNEXPECTED_MESS AGE	Unexpected message	
MCC_BAD_ATALK_PACKET	Invalid AppleTalk packet receiv	ed
MCC_ORPHAN_REQUEST	ATP Request discarded.	
MCC_ORPHAN_RESPONSE	ATP Response discarded.	
MCC_RESPONSE_SEQ_NU MBER	ATP Response has non-zero s	equence number
MCC_ORPHAN_RELEASE	ATP Release discarded.	

	Calls	
Function	Where Described

OpenHostSocket	See Section 2.21.1.7.1.	

Table 2.21-8 ATReceive Information.

2.21.1.2 atbuf.c

/simnet/mcc/libmcc/atbuf.c

atbuf.c implements buffer management in shared memory for AppleTalk datagrams.

2.21.1.2.1 ATAllocBuffer

ATAllocBuffer obtains an AppleTalk buffer from the shared pool. The function call is ATAllocBuffer(). Table 2.21-8 describes the parameters used, return values and possible errors generated by using this function.

	Internal Variabl	es
Variable	Туре	Where Typedef Declared
buf	register int	Standard C type.
	Datum Values	
	Return Values	
Return Value	Туре	Meaning
-1	int	operation failed, errno set to indicate error
buf	int	successful
	Errors	
Error Name	Reason for Error	
MCC_NO_BUFFER	No AppleTalk buffer in t	he shared pool.
	Calls	·

Table 2.21-10 ATFreeBuffer Information.

2.21.1.3 atnbp.c

/simnet/mcc/libmcc/atnbp.c

atnbp.c implements a simple name lookup on the AppleTalk Network. This module is used to lookup the address of the objects on the AppleTalk Network which are associated with MCC Macintosh consoles so that those objects may communicate with the MCC host system. Table 2.21-11 describes the variables used by atnbp.c.

	Variables	
Variable	Type	Where Typedef Declared
а	pointer to ATalkAddress	/simnet/mcc/include/at_addr.h
replyReceived	int	Standard C type.

Table 2.21-11 atnbp.c Variable Information.

2.21.1.3.1 NBPLookup

NBPLookup looks up an entity name and returns its address. This function implements a very limited name lookup. At most, one matching address will be found. Retry interval and count are fixed. The function call is NBPLookup(ojbStr, typeStr, zoneStr, a). Table 2.21-12 describes the parameters used, internal variables used, and functions called by using this function.

, , , , , , , , , , , , , , , , , , , 	Parameters	
Parameter	Туре	Where Typedef Declared
objStr	pointer to char	Standard C type.
typeStr	pointer to char	Standard C type.
zoneStr	pointer to char	Standard C type.
a	pointer to ATalkAddress	Standard Appletalk.
	Internal Variables	
Variable	Туре	Where Typedef Declared
bp	register pointer to char	Standard C type.
ddpSocket	int	Standard C type.
retry	int	Standard C type.
timeLeft	int	Standard C type.
msg	pointer to MCCMessageBuffer	/simnet/mcc/include/MCC_ipc .h
	Return Values	
Return Value	Type Type	Meaning
replyReceived	int	Address of entity
	Calls	
Function	Where Described	· · · · · · · · · · · · · · · · · · ·

Function	Where Described	
ActivateConsole	See Section 2.21.1.7.2.	

Table 2.21-12 NBPLookup Information.

2.21.1.3.2 NBPReceive

NBPReceive handles an incomming LkUp-Reply packet. The function checks to see that the message is from the AppleTalk network and that the packet is an NBP packet. It also checks to see that it is a LkUp-Reply packet and extracts is entity address. The function call is NBPReceive(type, kind, length, data, reqID). Table 2.21-13 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
type	int	Standard C type.
length	int _	Standard C type.
kind	long	Standard C type.
reqID	long	Standard C type.
data	register pointer to char	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
bp	register pointer to char	Standard C type.
	Errors	
Error Name	Reason for Error	
MCC_UNEXPECTED_MESS AGE	Unexpected message.	
MCC_BAD_ATALK_PACKET	Invalid AppleTalk packet recei	ved.
	Calls	
Function	Where Described	
TraceMessage	See Section 2.21.1.19.3.	
ATFreeBuffer	See Section 2.21.1.2.2.	

Table 2.21-13 NBPReceive Information.

2.21.1.4 atskt.c

/simnet/mcc/libmcc/atskt.c

atskt.c manages allocation and deallocation of data pathways to the AppleTalk network. Unix sockets are used to communicate with the ATRecv and ATSend processes which encapsulate the actual messages into AppleTalk packets.

2.21.1.4.1 ATAllocSocket

ATAllocSocket obtains an AppleTalk DDP socket. A YUMM socket is opened and associated with the DDP socket. The function call is ATAllocSocket(handler, priority). Table 2.21-14 describes the parameters used, errors returned and functions called using this function.

	Parameters	-
Parameter	Туре	Where Typedef Declared
handler	pointer to a void function	Standard C type.
priority	int	Standard C type.
	Internal Variables	
	Internal Variables	
Variable	Internal Variables Type	Where Typedef Declared
Variable s		Where Typedef Declared Standard C type.

Return Values		
Return Value	Type	Meaning
S	int	DDP socket number
	Errors	
Error Name	Reason for Error	
MCC_SOCKET_TABLE_FUL	Socket table full.	
	Calls	
Function	Where Described	
OpenSocket	See Section 2.21.2.10.3.

Table 2.21-14 ATAllocSocket Information.

2.21.1.4.2 ATFreeSocket

ATFreeSocket releases an AppleTalk DDP socket, *skt*. The function call is ATFreeSocket(skt). Table 2.21-15 describes the parameters used, errors returned and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
skt	int	Standard C type.	
	Internal Variables		
Variable	Type	Where Typedef Declared	
ср	register pointer to char	Standard C type.	
	Errors		
Error Name	Reason for Error		
MCC_SOCKET_NOT_OPEN	Socket is not in use.		
	Calls		
Function	Where Described		
CloseSocket	See Section 2.21.2.10.4.

NBPLookup	See Section 2.21.1.3.1.		

Table 2.21-15 ATFreeSocket Information.

2.21.1.4.3 SendPacket

SendPacket sends a packet on the AppleTalk network. The function call is SendPacket(msg). Table 2.21-16 describes the parameter used and function called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
msg	pointer to MCCMessageBuffer	/simnet/mcc/include/MCC_ipc .h
	Calls	
Function	Where Described	· · · · · · · · · · · · · · · · · · ·
SendMCCMsg1	Macro defined in /simnet/mcc/ii	nclude/MCC_ipc.h.
	Called By	
Function	Where Described

Table 2.21-16 SendPacket Information.

2.21.1.5 azimuth.c

/simnet/mcc/libmcc/azimuth.c

azimuth.c provides conversion from 32 bit fixed point fraction of a circle to mils and vice versa.

2.21.1.5.1 mil_to_fixedpt

mil_to_fixedpt converts mils to a 32 bit fixed point fraction of a circle. The function call is mil_to_fixedpt(mils). Table 2.21-17 describes the parameters used,internal variables used, and return values generated by using this function.

	Parameters		
Parameter	Туре	Where Typedef Declared	
mils	unsigned short	Standard C type.	
	Internal Variabl	AS	
Variable	Type	Where Typedef Declared	
pts	unsigned long	Standard C type.	
	Return Values	3	
Return Value	Туре	Meaning	
pts	unsigned long	32 bit fixed point fraction of a circle	

Table 2.21-17 mil_to_fixedpt Information.

2.21.1.5.2 fixedpt_to_mil

fixedpt_to_mil converts a 32 bit fixed point fraction of a circle to mils. The function call is fixedpt_to_mil(pts). Table 2.21-18 describes the parameters used, internal variables used, and return values generated by using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
pts	unsigned long	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
mils	unsigned short	Standard C type.
	Return Values	
Return Value	Type	Meaning
mils	unsigned short	the value of the circle in mils
	Called By	
Function	Where Described	
ProcessSimQueryRequest	See Section 2.21.1.25.4.	

Table 2.21-18 fixedpt_to_mil Information.

2.21.1.6 ccv.c

/simnet/mcc/libmcc/ccv.c

ccv.c handles requests from Macintoshes to place and remove computer controlled vehicles from the terrain. These routines package up the Macintosh requests and forward them on to the controlling MCC host process.

2.21.1.6.1 **DisplayCCV**

DisplayCCV makes a computer-controlled vehicle visible on the terrain. A message is sent to the Mother process and if the vehicle is placed, the data in the vehicle table will be changed to reflect its actual location. The function call is DisplayCCV(vehicle, type, alignment, role, company, loc, azimuth). Table 2.21-19 describes the parameters used, errors returned and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
vehicle	unsigned short	Standard C type.
guises	pointer to VehicleGuises	/simnet/common/include/prot ocolbasic.h
unit	pointer to OrganizationalUnit	/simnet/common/include/prot ocolbasic.h
marking	pointer to VehicleMarking	/simnet/common/include/prot ocolbasic.h
capabilities	VehicleCapabilities	/simnet/common/include/prot ocolbasic.h
loc	pointer to LongPt	/simnet/common/include/glob al/longpt.h
azimuth	short	Standard C type.

	Internal Variables	
Variable	Type	Where Typedef Declared
msg	MCCMessageBuffer	/simne/mcc/include/MCC_ipc.
respKind	long	Standard C type.
respLen	int	Standard C type.
errCode	int	Standard C type.
	Calls	
Function	Where Described	
Transact	See Section 2.21.2.10.9.	

Table 2.21-19 DisplayCCV Information.

2.21.1.6.2 HideCCV

HideCCV makes a computer-controlled vehicle, vehicle, invisible. The function call is HideCCV(vehicle). Table 2.21-20 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
vehicle	unsigned short	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
msg	MCCMessageBuffer	/simnet/mcc/include/MCC_ipc .h
	Calls	
Function	Where Described	
SendMCCMsg1	Macro defined in /simnet/mcc/include/MCC_ipc.h.	

Table 2.21-20 HideCCV Information.

2.21.1.7 console.c

/simnet/mcc/libmcc/console.c

This module forms the high level interface mechanism used by MCC host processes to communicate with the Macintosh consoles they control. It provides a transaction based communication mechanism through the other lower level transaction services. Table 2.21-21 describes the variables used by console.c.

Variables		
Variable	Туре	Where Typedef Declared
hostSocket	int	Standard C type.
(requestHandler)()	function that returns int	Standard C type.
(responseHandler)()	function that returns int	Standard C type
trans	pointer to Transaction	/simnet/mcc/include/bridge.h

Table 2.21-21 console.c Variable Information.

2.21.1.7.1 OpenHostSocket

OpenHostSocket opens a socket that the host console process will use to receive requests. First a socket is allocated through which requests may be received and then asynchroneus ATP GetRequests are queued up. The function call is OpenHostSocket(reqHdler, rspHdler). Table 2.21-22 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
reqHdler	pointer to function that returns int	Standard C type.
rspHdler	pointer to function that returns int	Standard C type.
<u> </u>	Internal Variables	
Variable	Туре	Where Typedef Declared
	register int	Standard C type.
	Calls	
Function	Where Described	
ATAllocSocket	See Section 2.21.1.4.1.	
ATReceive	See Section 2.21.1.1.7.

Table 2.21-22 OpenHostSocket Information.

2.21.1.7.2 ActivateConsole

ActivateConsole activates the Macintosh console, *console*. The name of the console on the AppleTalk network is looked up and then a ConsoleStartUp request is sent. The function call is ActivateConsole(console). Table 2.21-23 describes the parameters used, errors returned and functions called using this function.

Type		
	Where Typedef Declared	
int	Standard C type.	
internal Variables		
Туре	Where Typedef Declared	
ConsoleStartUpRequest	/simnet/mcc/include/console.

ATPTransact	See Section 2.21.1.7.3.	

Table 2.21-23 ActivateConsole Information.

2.21.1.7.3 ATPTransact

ATPTransact sends an ATP request and gets a response. The function call is ATPTransact(console, code, req, reqLength, rsp, rspLength, xo). Table 2.21-24 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
console	int	Standard C type.
code	long	Standard C type.
req	pointer to char	Standard C type.
reqLength	int	Standard C type.
rsp	pointer to char	Standard C type.
rspLength	int	Standard C type.
xo	int	Standard C type.

Table 2.21-24 ATPTransact Information.

2.21.1.7.4 ATPPut

ATPPut sends an ATP Request to a console, not waiting for the response. The function call is ATPPut(console, code, req, reqLength, xo). Table 2.21-25 describes the parameters used, errors returned and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
console	int	Standard C type.
code	long	Standard C type.
req	pointer to char	Standard C type.
reqLength	int	Standard C type.
xo	int	Standard C type.
Variable	Internal Variables Type	Where Typedef Declared
	internal Variables	
t	pointer to Transaction	/simnet/mcc/include/bridge.h
	Calls	
Function	Where Described	
ATAllocBuffer	See Section 2.21.1.2.1.	
ATPPutComplete	See Section 2.21.1.7.5.	
ATPRequest	See Section 2.21.1.1.4.	

Table 2.21-25 ATPPut Information.

2.21.1.7.5 ATPPutComplete

ATPPutComplete is the completion routine for ATPPut. It is called if a response has been received or the transaction has timed out. The function call is ATPPutComplete(t). Table 2.21-26 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
t	pointer to Transaction	/simnet/mcc/include/bridge.h
	Calls	
Function	Where Described	
ATFreeBuffer	See Section 2.21.1.2.2.	
	Called By	
Function	Where Described

Table 2.21-28 ConsoleReleaseArrived Information.

2,21.1.8 cew.c

/simnet/mcc/libmcc/cew.c

cew.c contains a routine for accessing the CEW asset parameters in shared memory.

2.21.1.8.1 GetCEWParameters

GetCEWParameters finds the CEWParameters object in shared memory corresponding to a particular asset. The function call is GetCEWParameters(kind, assetNumber). Table 2.21-29 describes the parameters used and errors returned using this function

Parameters		
Parameter	Туре	Where Typedef Declared
kind	short	Standard C type.
assetNumber	short	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
pars	register pointer to	/simnet/mcc/include/MCC_par
	CEWParameters	s.h
	·	
	Return Values	
Return Value	Type	Meaning
pars + assetNumber	pointer to CEWParameters	CEWParameters object in shared memory that corresponds the the asset specified by assetNumber
	Errors	
Error Name	Reason for Error	
MCC_TRUCK_BADPARM	Bad truck parameter.	

Table 2.21-29 GetCEWParameters Information.

2.21.1.9 data.c

/simnet/mcc/libmcc/data.c

This module defines global data segments shared among all processes. Table 2.21-30 shows the variables defined in data.c.

Variables		
Variable	Туре	Where Typedef Declared
copyright	pointer to char	Standard C type.
authors	pointer to char	Standard C type.
mcc	pointer to MCCParameters	/simnet/mcc/include/MCC_Pars.h
vehicles	pointer to VehicleTable	/simnet/mcc/include/veh_table.h
vList	pointer to FQueue_Head_t	/simnet/mcc/libmcc/fqueue.h
vStatusList	pointer to FQueue_Head_t	/simnet/mcc/libmcc/fqueue.h
aTalk	pointer to ATalkInfo	/simnet/mcc/include/bridge.h
thisProcess	int	Standard C type.
mccSemaphores	int	Standard C type.

Table 2.21-30 data.c Information.

2.21.1.10 decode.c

/simnet/mcc/libmcc/decode.c

decode.c contains routines for dealing with rotation matrices.

2.21.1.10.1 DecodeHullToWorldMatrix

DecodeHullToWorldMatrix derives a rotation about each of three axes from the hull to world transformation matrix. The function call is DecodeHullToWorldMatrix(m, rot). Table 2.21-31 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
m[3][3]	float	Standard C type.
rot[3]	float	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
d	double	Standard C type.
	Called By	
Function	Where Described	
ProcessSimQueryRequest	See Section 2.21.1.25.4.	

Table 2.21-31 DecodeHullToWorldMatrix Information.

2.21.1.10.2 DecodeRotationVector

DecodeRotationVector decodes a vector, v, composed of sine and cosine into a single angle in the range of -PI to +PI radians. The function call is DecodeRotationVector(v). Table 2.21-32 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
V	array of 2 float	Standard C type.
	Internal Variab	les
Variable	Type	Where Typedef Declared
f	float	Standard C type.
	Return Value	S
Return Value	Туре	Meaning
f	float	Angle of vector.

Table 2.21-32 DecodeRotationVector Information.

2.21.1.11 error.c

/simnet/mcc/libmcc/error.c

The MCC takes advantage of exception handling under RTU V4.0A Unix in order to display and report erroneous or interesting behavior during the course of an exercise. The exception handler traps all exceptions generated by the MCC. Table 2.21-33 shows the external variables used by error.c.

External Variables		
Variable	Type	Where Typedef Declared
errno	extern int	Standard C.
severity	extern int	Standard C.
sys_nerr	extern int	Standard C.
sys_errlist	extern pointer to array of char	Standard C.

Table 2.21-33 error.c External Variable Information.

2.21.1.11.1 InitErrorHandling

InitErrorHandling initializes a process's handling of errors. The function call is InitErrorHandling(progname). Table 2.21-34 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
progname	pointer to char	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
str	array of 30 char	Standard C type.
	Calls	
Function	Where Described	
MCC_errinit	See Section 2.21.1.33.1.	•
	Called By	
Function	Where Described	
InitializeProcess	See Section 2.21.1.19.1.	·

Table 2.21-34 InitErrorHandling Information.

2.21.1.11.2 SendErrorReport

SendErrorReport sends an Error Report PDU, which is of interest to the NOM system. The function call is SendErrorReport(). Table 2.21-35 describes the internal variables used and functions called using this function.

	Internal Variables	
Variable	Type	Where Typedef Declared
buff	array of maxNetworkPDUSize char	Standard C type.
mPDU	pointer to ManagementPDU	/simnet/common/include/prot ocol/p_mgmt.h
errorVariant	pointer to ErrorReportVariant	/simnet/common/include/prot ocol/p_mgmt.h
errorText	array of 513 char	Standard C type.
max_err_len	unsigned int	Standard C type.
mSize	unsigned short	Standard C type.
	Return Values	
Return Value	Туре	Meaning
severity	int	The severity of the error code.
	Calls	
Function	Where Described	
MGMT_HDR_SIZE	macro defined in /simnet/common/include/protocol/p_mgmt.h	

Table 2.21-35 SendErrorReport Information.

2.21.1.11.3 MCC_SystemError

MCC_SystemError reports an error encountered in a system call. functionName is the name of the function you are currently in and systemCallName is the name of the system call tht caused the error. The function call is MCC_SystemError(functionName, systemCallName). Table 2.21-36 describes the parameters used and errors returned using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
functionName	pointer to char	Standard C type.
systemCallName	pointer to char	Standard C type.
	Internal Variables	s
Variable	Туре	Where Typedef Declared
S	pointer to char	Standard C type.
str	array of 10 char	Standard C type.
	Errors	
Error Name	Reason for Error	
MCC_SYSTEM_ERROR	System error.	

Called By		
Function	Where Described	
OpenNetworkInterface	See Section 2.21.1.22.3.	
SpawnProcess	See Section 2.21.1.26.1.	

Table 2.21-36 MCC_SystemError Information.

2.21.1.11.4 VehicleIDToTrailer

VehicleIDToTrailer returns an ASCII string identifying a vehicle. This routine returns a string of the form <trailer><element>, given a vehicle number, vehicleID. If the simulator is not one of ours, "unknown" is returned. The returned string is in storage internal to this routine. The function call is VehicleIDToTrailer(vehicleID). Table 2.21-37 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
vehicleID	pointer to VehicleID	/simnet/common/include/prot ocol/basic.h
	Internal Variables	
Variable	Type	Where Typedef Declared
sim	register pointer to SimulatorStatus	/simnet/mcc/include/veh_table.h
veh	register pointer to VehicleIDStatus	/simnet/mcc/include/veh_table.h
buffer	array of 10 char	Standard C type.
unknown	pointer to char	Standard C type.
	Return Values	
Return Value	Туре	Meaning
buffer	pointer to char	String identifying vehicle.
unknown	pointer to char	String identifying vehicle.
	Calls	
Function	Where Described	
FQueue_Retrieve	See Section 2.21.1.13.7.	

Table 2.21-37 VehicleIDToTrailer Information.

2.21.1.12 faad.c

/simnet/mcc/libmcc/faad.c

Forward Area Air Defense vehicles (FAAD) have specific status information relating to parameters such as fuel and armament. This module decodes and encodes FAAD status information for communication between the MCC host process and the SCC Macintosh console.

2.21.1.12.1 EncodeVehicleStatusFAAD

Encode Vehicle Status FAAD builds an FAAD Vehicle Specific Status structure from data supplied by the SCC or Place console. The function call is Encode Vehicle Status FAAD (loc, vss). Table 2.21-38 describes the parameters used by this function.

Parameters			
Parameter Type Where Typedef Declar			
loc	pointer to SimVehicleStatus	/simnet/mcc/include/sim_xact. h	
vss	VehicleSpecificStatus	/simnet/common/include/prot ocol/status.h	

Table 2.21-38 EncodeVehicleStatusFAAD Information.

2.21.1.12.2 DecodeVehicleStatusFAAD

DecodeVehicleStatusFAAD decodes an FAAD VehicleSpecificStatus structure into a form supplied to the SCC Macintosh. The function call is DecodeVehicleStatusFAAD(vss, loc). Table 2.21-39 describes the parameters usedby this function.

Parameters		
Parameter	Type	Where Typedef Declared
vss	pointer to VehicleSpecificStatus	/simnet/common/include/prot ocol/status.h
loc	SimVehicleStatus	/simnet/mcc/include/sim_xact.

Table 2.21-39 DecodeVehicleStatusFAAD Information.

2.21.1.12.3 TotalFuelFAAD

TotalFuelFAAD adds up the fuel aboard an FAAD. fuel gets the amount of total fuel. The function call is TotalFuelFAAD(vss, fuel). Table 2.21-40 describes the parameters used by this function.

	Parameters	
Parameter	Type	Where Typedef Declared
vss	VehicleSpecificStatus	/simnet/common/include/prot ocol/status.h
fuel	pointer to float	Standard C type.

Table 2.21-40 TotalFuelFAAD Information.

2.21.1.13 fqueue.c

/simnet/mcc/libmcc/fqueue.c

The fqueue module provides the functionality of a fast, hash accessed queue mechanism. The queue is implemented using offsets from a known point in memory to accesses hash and data buckets. An arbitrary number of fqueue objects may exist at any time, and all are independent of each other at the ADT level. Routines are provided to insert, remove, initialize or iterate through a queue. Vehicle Appearance packets, status packets and a list

of activation locations are currently stored using fqueue structures since they must be accessed quickly by a 48 bit key.

2.21.1.13.1 Hash_Get_Entry

Hash_Get_Entry gets an entry from the queue. The function call is Hash_Get_Entry(FQueue_Head, Key, Hash_Bucket_Ptr, Hash_Func). Table 2.21-41 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
FQueue_Head	pointer to FQueue_Head_t	/simnet/mcc/libmcc/fqueue.h
Key	pointer to char	Standard C type.
Hash_Bucket_Ptr	pointer to pointer to Hash_Entry_t	/simnet/mcc/libmcc/fqueue.h
(Hash_Func)()	unsigned int	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
Bucket_Index	unsigned int	Standard C type.
Queue_Entry	pointer to FQueue_t	/simnet/mcc/libmcc/fqueue.h
Hash_Bucket	pointer to Hash_Entry_t	/simnet/mcc/libmcc/fqueue.h
Hash_Table	pointer to Hash_Entry_t	/simnet/mcc/libmcc/fqueue.h
i	unsinged int	Standard C type.
Zone	pointer to char	Standard C type.
	Return Values	
Return Value	Туре	Meaning
Queue_Entry	pointer to FQueue_t	The specified queue entry.
NULL	pointer to FQueue_t	There is no queue entry.
	Called By	
Function	Where Described	
FQueue_Insert	See Section 2.21.1.13.4.	
FQueue_Remove	See Section 2.21.1.13.5.	
FQueue_Retrieve	See Section 2.21.1.13.7.	

Table 2.21-41 Hash_Get_Entry Information.

2.21.1.13.2 Alloc_Free

Alloc_Free is currently a dummy function which contains no code and always returns 0. The function call is Alloc_Free(FQueue_Head). Table 2.21-42 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
FQueue_Head	pointer to FQueue_Head_t	/simnet/mcc/libmcc/fqueue.h

Return Values		
Return Value	Туре	Meaning
0	int	Always returned.
	Called By	
Function	Where Described	
FQueue Insert	See Section 2.21.1.13.4.	

Table 2.21-42 Alloc_Free Information.

2.21.1.13.3 FQueue_Create

FQueue_Create creates an fqueue structure. The function call is FQueue_Create(FQueue_Head_Ptr, Max_Queue_Size, Entry_Size, Alloc_Func, Hash_Func, Key_Size, Table_Size, U_Param, U_Param_Size). Table 2.21-43 describes the parameters used by this function.

Parameters		
Parameter	Type	Where Typedef Declared
FQueue_Head_Ptr	pointer to pointer to FQueue_Head_t	/simnet/mcc/libmcc/fqueue.h
Max_Queue_Size	int	Standard C type.
Entry_Size	int	Standard C type.
(Alloc_Func)()	function that returns pointer to int	Standard C type.
(Hash_Func)()	function that returns pointer to unsigned int	Standard C type.
Key_Size	int	Standard C type.
Table_Size	int	Standard C type.
U_Param	pointer to char	Standard C type.
U_Param_Size	int	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
FQueue_Head	pointer to FQueue_Head_t	/simnet/mcc/libmcc/fqueue.h
New_Freee_Entry	pointer to FQueue_t	/simnet/mcc/libmcc/fqueue.h
Prev_Free_Entry	pointer to FQueue_t	/simnet/mcc/libmcc/fqueue.h
Hash_Table	pointer to Hash_Entry_t	/simnet/mcc/libmcc/fqueue.h
Mem_Block	pointer to char	Standard C type.
Zone	pointer to char	Standard C type.
Head Mem Block	pointer to FQueue_Head_t	/simnet/mcc/libmcc/fqueue.h
Start_Of_Zone	unsigned long	Standard C type.
į	int	Standard C type.
Total_Entry_Size	int	Standard C type.
Total_Memory	int	Standard C type
	Return Values	
Return Value	Type	Meaning
Total Memory	int	The total memory used by the fqueue structure.

Table 2.21-43 FQueue_Create Information.

2.21.1.13.4 FQueue_Insert

FQueue_Insert inserts an entry in the fqueue structure. The function call is FQueue_Insert(Fqueue_Head, Key, User_Data, Hash_Func). Table 2.21-44 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
FQueue_Head	pointer to FQueue_Head_t	/simnet/mcc/libmcc/fqueue.h
Key	pointer to char	Standard C type.
User_Data	pointer to char	Standard C type.
(Hash_Func)()	function that returns pointer to	Standard C type.
	unsigned int	
	Internal Variables	
Variable	Туре	Where Typedef Declared
Prev_Free_Entry	pointer to FQueue_t	/simnet/mcc/libmcc/fqueue.h
New_Entry	pointer to FQueue_t	/simnet/mcc/libmcc/fqueue.h
Prev_Entry_	pointer to FQueue_t	/simnet/mcc/libmcc/fqueue.h
Queue_Entry	pointer to FQueue_t	/simnet/mcc/libmcc/fqueue.h
Next_Entry	pointer to FQueue_t	/simnet/mcc/libmcc/fqueue.h
Hash_Bucket	pointer to Hash_Entry_t	/simnet/mcc/libmcc/fqueue.h
Zone	pointer to char	Standard C type.
	Return Values	,
Return Value	Туре	Meaning
0	int	Successful
-1	int	This entry is first in the list.
1	int	Unsuccessful
	Calls	
Function	Where Described	
Hash_Get_Entry	See Section 2.21.1.13.1.	
Alloc_Free	See Section 2.21.1.13.2.	

Table 2.21-44 FQueue_Insert Information.

2.21.1.13.5 FQueue_Remove

FQueue_Remove removes an entry from the fqueue structure. The function call is FQueue_Remove(FQueue_Head, Key, User_Data, Flag, Hash_Func). Table 2.21-45 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
FQueue_Head	pointer to FQueue_Head_t	/simnet/mcc/libmcc/fqueue.h
Key	pointer to char	Standard C type.
User_Data	pointer to char	Standard C type.
Flag	unsigned char	Standard C type.
(Hash_Func)()	function that returns pointer to unsigned int	Standard C type.

	Internal Variables	
Variable	Туре	Where Typedef Declared
Entry	pointer to FQueue_t	/simnet/mcc/libmcc/fqueue.h
Prev_Entry	pointer to FQueue_t	/simnet/mcc/libmcc/fqueue.h
Next_Entry	pointer to FQueue_t	/simnet/mcc/libmcc/fqueue.h
Hash_Bucket	pointer to Hash_Entry_t	/simnet/mcc/libmcc/fqueue.h
Hash_Get_Entry()	pointer to FQueue_t	/simnet/mcc/libmcc/fqueue.h
Zone	pointer to char	Standard C type.
	Return Values	
Return Value	Type	Meaning
-1	int	Unsuccessful
0	int	Successful
	Calls	
Function	Where Described	
Hash_Get_Entry	See Section 2.21.1.13.1.	

Table 2.21-45 FQueue Remove Information.

2.21.1.13.6 FQueue_Scan

FQueue_Scan finds the previous entry in the fqueue structure. The function call is FQueue_Scan(FQueue_Head, Prev_Entry_Ptr). Table 2.21-46 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
FQueue_Head	pointer to FQueue_Head_t	/simnet/mcc/libmcc/fqueue.h
Prev_Entry_Ptr	pointer to pointer to FQueue_t	/simnet/mcc/libmcc/fqueue.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
Prev_Entry	pointer to FQueue_t	/simnet/mcc/libmcc/fqueue.h
Zone	pointer to char	Standard C type.
	Return Values	
Return Value	Туре	Meaning
&Zone[Prev_Entry ->Data_Offset	pointer to char	The previous entry
NULL	pointer to char	There is no previous entry

Table 2.21-46 FQueue_Scan Information.

2.21.1.13.7 FQueue_Retrieve

FQueue_Retrieve an entry from the fqueue structure. The function call is FQueue_Retrieve(FQueue_Head, Key, Hash_Func). Table 2.21-47 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
FQueue_Head	pointer to FQueue_Head_t	/simnet/mcc/libmcc/fqueue.h
Key	pointer to char	Standard C type.
(Hash_Func)()	function that returns pointer to unsigned int	Standard C type.
	internal Variables	
Variable	Type	Where Typedef Declared
Entry	pointer to FQueue_t	/simnet/mcc/libmcc/fqueue.h
Hash_Bucket	pointer to Hash_Entry_t	/simnet/mcc/libmcc/fqueue.h
Hash_Get_Entry()	pointer to FQueue_t	/simnet/mcc/libmcc/fqueue.h
Zone	pointer to char	Standard C type.
	Return Values	
Return Value	Туре	Meaning
NULL	pointer to char	The entry is NULL
&Zone[Entry->Data_Offset]	pointer to char	The specified entry.
	Calls	
Function	Where Described	
Hash_Get_Entry	See Section 2.21.1.13.1.	
riasii_Get, Chilly	1 366 36CHOII 2.21.1.13.1.	
	Called By	
Function	Where Described	
VehicleIDToTrailer	See Section 2.21.1.11.4.	

Table 2.21-47 FQueue_Retrieve Information.

2.21.1.13.8 FQueue_Dump_Bucket

FQueue_Dump_Bucket is currently a dummy function. The function call is FQueue_Dump_Bucket(FQueue_Head, Key). Table 2.21-48 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
FQueue_head	pointer to FQueue_Head_t	/simnet/mcc/libmcc/fqueue.h
Key	pointer to char	Standard C type.
	Internal Variables	
Variable		Where Typedef Declared
	Туре	
Entry	pointer to FQueue_t	/simnet/mcc/libmcc/fqueue.h
Hash_Bucket	pointer to Hash_Entry_t	/simnet/mcc/libmcc/fqueue.h
Bucket_Index	int	Standard C type.
i	int	Standard C type.
i	int	Standard C type.

Table 2.21-48 FQueue_Dump_Bucket Information.

2.21.1.13.9 FQueue_Analyze

FQueue_Analyze is currently a dummy function. The function call is FQueue_Analyze(FQueue_Head). Table 2.21-49 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
FQueue_Head	pointer to FQueue_Head_t	/simnet/mcc/libmcc/fqueue.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
	int	Standard C type.
Depth	array of 100 int	Standard C type.
Used	int	Standard C type.
Entries	int	Standard C type.
Hash_Bucket	pointer to Hash_Entry_t	/simnet/mcc/libmcc/fqueue.h

Table 2.21-49 FQueue_Analyze Information.

2.21.1.14 fred.c

/simnet/mcc/libmcc/fred.c

Fully Reconfigurably Evaluation Device vehicles (FRED) have specific status information relating to parameters such as fuel and armament. This module decodes and encodes FRED status information for communication between the MCC host process and the SCC Macintosh console.

2.21.1.14.1 EncodeVehicleStatusFRED

EncodeVehicleStatusFRED builds an FRED status structure in a GenericVehicleStatus from data supplied by the SCC or Place console. The function call is EncodeVehicleStatusFRED(loc, vss). Table 2.21-50 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
loc	pointer to SimVehicleStatus	/simnet/mcc/include/sim_xact. h
vss	pointer to VehicleSpecificStatus	/simnet/common/include/prot ocol/status.h
	Called By	
Function	Where Described	
ProcessSimInitRequest	See Section 2.21.1.25.2.	

Table 2.21-50 EncodeVehicleStatusFRED Information.

2.21.1.14.2 DecodeVehicleStatusFRED

DecodeVehicleStatusFRED decodes an FRED VehicleSpecificStatus structure into a form supplied to the SCC Macintosh. The function call is DecodeVehicleStatusFRED(vss, loc). Table 2.21-51 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
vss	pointer to VehicleSpecificStatus	/simnet/common/include/prot ocol/status h
loc	pointer to SimVehicleStatus	/simnet/mcc/include/sim_xact.
	Called By	
Function	Where Described	
ProcessSimQueryRequest	See Section 2.21.1.25.4.	

Table 2.21-51 DecodeVehicleStatusFRED Information.

2.21.1.14.3 fred_encode_failures

fred_encode_failures fills in the error bits of the failures. The function call is fred_encode_failures(vehicle_status). Table 2.21-52 describes the parameters used by this function.

Parameters		
Parameter	Type	Where Typedef Declared
vehicle_status	pointer to VehicleStatus	/simnet/common/include/prot ocol/status.h
<u></u>	Calls	
Function	Where Described	
veh_subsys_encode_air_failures	See Section 2.21.1.30.3.	
	Called By	
Function	Where Described	
ProcessSimInitRequest	See Section 2.21.1.25.2.	

Table 2.21-52 fred_encode failures Information.

2.21.1.15 generic.c

/simnet/mcc/libmcc/generic.c

generic.c contains routines for handling generic vehicles. Currently, the only information handled is fuel.

2.21.1.15.1 TotalFuelGeneric

TotalFuelGeneric adds up the fuel aboard a Generic vehicle. *fuel* gets the amount of total fuel. The function call is TotalFuelGeneric(vss, fuel). Table 2.21-53 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
vss	VehicleSpecificStatus	/simnet/common/include/prot ocol/status.h
fuel	pointer to float	Standard C type.
	Called By	
Function	Where Described	
TotalVehicleFuel	See Section 2.21.1.28.1.	

Table 2.21-53 TotalFuelGeneric Information.

2.21.1.16 grid.c

/simnet/mcc/libmcc/grid.c

Internally, the MCC uses Cartesian coordinates to coordinate activity of its asset vehicles as they exist on the terrain. The Macintosh user interface consoles display and accept coordinate information in Universal Transverse Mercator format. grid.c provides for loading information from the terrain database onto the Macintosh consoles in the correct format.

2.21.1.16.1 ProcessGridInfoRequest

ProcessGridInfoRequest processes a request for GridInfo from a Mac. The function call is ProcessGridInfoRequest(t). Table 2.21-54 describes the parameters used, internal variables used, and return values generated by using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
t	pointer to Transaction	/simnet/mcc/include/bridge.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
req	pointer to char	Standard C type.
rsp	register pointer to GridZone	/simnet/common/libsrc/libtdb/ map.h
	Return Values	
Return Value	Type	Meaning
1	int	successful
0	int	operation failed, errno set to indicate error
	Calls	
Function	Where Described	
ATPRequestData	Macro defined in /simnet/mcc/include/bridge.h.	
SendConsoleResponse	See Section 2.21.1.7.6.	

Table 2.21-54 ProcessGridInfoRequest Information.

2.21.1.17 guise.c /simnet/mcc/libmcc/guise.c

Vehicles on the battlefield can have several discrete pairs of guises depending upon the force the simulating entity belongs to. guise.c provides the mapping from a specific vehicle type simulated or activated from an MCC to the pair of guises appropriate to that vehicle. For a more complete discussion of guise semantics, refer to the document, "The SIMNET Network and Protocols," July, 1989. TAble 2.21-55 describes the variables used by guise.c.

Variables		
Variable	Type	Where Typedef Declared
guiseTable[NUM_OBJECT_G ROUPS][NUM_COUNTRIES]	matrix of ObjectType	/simnet/common/include/prot ocol/basic.h

Table 2.21-55 guise.c Variable Information.

2.21.1.17.1 GetGuises

GetGuises fills in the guises appropriate to the input parameters. The function call is GetGuises(battleScheme, forceID, objType, guises). Table 2.21-56 describes the parameters used, internal variables used, and return values generated by using this function.

	Parameter s	
Parameter	Туре	Where Typedef Declared
battleScheme	int	Standard C type.
forceID	ForceID	/simnet/common/include/prot ocol/basic.h
objType	ObjectType	/simnet/common/include/prot ocol/basic.h
guises	pointer to VehicleGuises	/simnet/common/include/prot ocol/basic.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
scheme	pointer to BattleSchemes	/simnet/mcc/libmcc/guise.h
i	int	Standard C type.
	int	Standard C type.
distContryIndex	int	Standard C type.
otherCountryIndex	int	Standard C type.
	Date visit in the second	
Datum Value	Return Values	
Return Value	Туре	Meaning
-1	int	Invalid forceID or objType.
0	int	Successful: guises filled in.
	Called By	
Function	Where Described	
ProcessSimInitRequest	See Section 2.21.1.25.2.	

Table 2.21-56 GetGuises Information.

2.21.1.18 hash.c

/simnet/mcc/libmcc/hash.c

The hashing functions used by the MCC to hash the 48 bit keys used in various fqueue objects are defined here. The hash functions all return hash table bucket indexes when given a key to hash.

2.21.1.18.1 vList Hash

vList_Hash returns a hash table bucket index for the vehicle list fqueue. The function call is vList_Hash(key, Param). Table 2.21-57 describes the parameters used, internal variables used, and return values generated by using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
key	register pointer to unsigned short	Standard C type.
Param	register pointer to MCCParameters	/simnet/mcc/include/MCC_par s.h
	Internal Veriables	
	Internal Variables	
Variable	Type	Where Typedef Declared
index	register unsigned long	Standard C type.
<u> </u>	Return Values	
Return Value	Туре	Meaning
index	register unsigned long	Hash table bucket index

Table 2.21-57 vList_Hash Information.

2.21.1.18.2 vStatusList_Hash

vStatusList_Hash returns a hash table bucket index for the vehicle status list fqueue. The function call is vStatusList_Hash(key, Param). Table 2.21-58 describes the parameters used, internal variables used, and return values generated by using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
key	register pointer to unsigned short	Standard C type
Param	register pointer to MCCParameters	/simnet/mcc/include/MCC_par s.h
	Internal Variables	
Variable		Where Typedef Declared
	Type	
index	register unsigned long	Standard C type.
	Return Values	
Return Value	Туре	Meaning
index	register unsigned long	Hash table bucket index

Table 2.21-58 vStatusList_Hash Information.

2,21.1.19 init.c

/simnet/mcc/libmcc/init.c

All MCC processes initialize or attach to sections of shared memory and critical regions when they are first activated. The processes are all synchronized and initial communications are set up. init.c controls the initialization sequence. Table 2.21-59 describes the variables used by init.c.

Variables		
Variable	Туре	Where Typedef Declared
progname	pointer to char	Standard C type.

Table 2.21-59 init.c Variable Information.

2.21.1.19.1 InitializeProcess

InitializeProcess initializes the standard MCC process environment. The function call is InitializeProcess(processNumber, processName, handler, topLevel). Table 2.21-60 describes the parameters used, internal variables used, and return values generated by using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
processNumber	int	Standard C type.
processName	pointer to char	Standard C type.
handler	pointer to function returning int	Standard C type.
topLevel	int	Standard C type.
	Internal Variables	
Variable		Where Typedet Declared
Variable	Туре	Where Typedef Declared
<u> </u>	register short	Standard C type.
	Calls	
Function	Where Described	
InitErrorHandling	See Section 2.21.1.11.1.	
OpenNetworkInterface	See Section 2.21.1.22.3.	
AttachLocks	See Section 2.21.2.6.1.	
AttachSharedMem	See Section 2.21.2.7.1.	
YUMMInit	See Section 2.21.2.10.1.	
YUMMProcess	See Section 2.21.2.10.2.	
OpenSocket	See Section 2.21.2.10.3.	
InitAlarms	See Section 2.21.2.4.1.	

Table 2.21-60 InitializeProcess Information.

2.21.1.19.2 TraceHandler

TraceHandler is the front-end to TraceMessage for registering with YUMM. The function call is TraceHandler(type, tid, dstSkt, rspSkt, kind, length, data). Table 2.21-61 describes the parameters used and functions used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
type	char	Standard C type.
tid	char	Standard C type.
dstSkt	YUMMSocket	/simnet/rcs/libipc/yumm.h
rspSkt	YUMMSocket	/simnet/rcs/libipc/yumm.h
kind	long	Standard C type.
length	int	Standard C type.
data	pointer to char	Standard C type.
	Calis	
Function	Where Described	
TraceMessage	See Section 2.21.1.19.3.	•

Table 2.21-61 TraceHandler Information.

2.21.1.19.3 TraceMessage

TraceMessage prints a message received by an MCC process. The function call is TraceMessage(kind, msg). Table 2.21-62 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
kind	long	Standard C type.
msg	register pointer to MCCMessageBuffer	/simnet/mcc/include/MCC_ipc .h
	Called By	
Function	Where Described	
ATReceive	See Section 2.21.1.1.7.	
NBPReceive	See Section 2.21.1.3.2.	
TraceHandler	See Section 2.21.1.19.2.	
ProcessSimInitRequest	See Section 2.21.1.25.2.	

Table 2.21-62 TraceMessage Information.

2.21.1.19.4 InitUnit

InitUnit initializes information for a unit. The function call is InitUnit(unit forceID, type, army, corps, division, brigade, battalion, company, platoon, section, squad). Table 2.21-63 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
unit	pointer to OrganizationalUnit	/simnet/common/include/prot ocol/basic.h
forceID	int	Standard C type.
type	unsigned char	Standard C type.
army	int	Standard C type.
corps	int	Standard C type.
division	int	Standard C type.
brigade	int	Standard C type.
battalion	int	Standard C type.
company	int	Standard C type.
platoon	int	Standard C type.
section	int	Standard C type.
squad	int	Standard C type.
	Called By	
Function	Where Described	
ProcessSimInitRequest	See Section 2.21.1.25.2.	

Table 2.21-63 InitUnit Information.

2.21.1.20 m1.c

/simnet/mcc/libmcc/m1.c

M1 tanks have specific status information relating to parameters such as fuel and armament. m1.c decodes and encodes M1 status information for communication between the MCC host process and the SCC Macintosh console.

2.21.1.20.1 EncodeVehicleStatusM1

EncodeVehicleStatusM1 builds an M1 VehicleSpcificStatus structure from data supplied by the SCC or Place console. The function call is EncodeVehicleStatusM1(loc, vss). Table 2.21-64 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
loc	pointer to SimVehicleStatus	/simnet/mcc/include/sim_xact. h
vss	pointer to VehicleSpecificStatus	/simnet/common/include/prot ocol/status.h
	Called By	
Function	Where Described	
ProcessSimInitRequest	See Section 2.21.1.25.2.	

Table 2.21-64 EncodeVehicleStatusM1 Information.

2.21.1.20.2 DecodeVehicleStatusM1

Decode Vehicle Status M1 decodes an M1 Vehicle Specific Status structure into a form supplied to the SCC Macintosh. The function call is Decode Vehicle Status M1 (vss, loc). Table 2.21-65 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
vss	pointer to VehicleSpecificStatus	/simnet/common/include/prot ocol/status.h
loc	pointer to SimVehicleStatus	/simnet/mcc/include/sim_xact. h
	Called By	
Function	Where Described	
ProcessSimQueryRequest	See Section 2.21.1.25.4.	

Table 2.21-65 DecodeVehicleStatusM1 Information.

2.21.1.20.3 TotalFuelM1

TotalFuelM1 adds up the fuel aboard an M1. *fuel* gets the amount of total fuel. The function call is TotalFuelM1(vss, fuel). Table 2.21-66 describes the parameters used by this function.

Parameters		
Parameter	ітуре	Where Typedef Declared
vss	pointer to VehicleSpecificStatus	/simnet/common/include/prot ocol/status.h
fuel	pointer to float	Standard C type.
	Called By	
Function	Where Described	
TotalVehicleFuel	See Section 2.21.1.28.1.	

Table 2.21-66 TotalFuelM1 Information.

2.21.1.20.4 m1_encode_failures

m1_encode_failures fills in the error bits for the failures. The function call is m1_encode_failures(vehicle_status). Table 2.21-67 describes the parameters used by this function.

Parameters		
Parameter	Type	Where Typedef Declared
vehicle_status	pointer to VehicleStatus	/simnet/common/include/prot ocol/status.h
	Calls	
Function	Where Described	
veh_subsys_encode_ground	See Section 2.21.1.30.2.	

Called By		
Function	Where Described	
ProcessSimInitRequest	See Section 2.21.1.25.2.	

Table 2.21-67 ml_encode_failures Information.

2.21.1.21 m2.c

/simnet/mcc/libmcc/m2.c

M2/M3 APCs have specific status information relating to parameters such as fuel and armament. m2.c decodes and encodes M2/M3 status information for communication between the MCC host process and the SCC Macintosh console.

2.21.1.21.1 EncodeVehicleStatusM2

EncodeVehicleStatusM2 builds an M2 VehicleSpcificStatus structure from data supplied by the SCC or Place console. The function call is EncodeVehicleStatusM2(loc, vss). Table 2.21-68 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
loc	pointer to SimVehicleStatus	/simnet/mcc/include/sim_xact.
vss	pointer to VehicleSpecificStatus	/simnet/common/include/prot ocol/status.h
	Called By	
Function	Where Described	
ProcessSimInitRequest	See Section 2.21.1.25.2.	

Table 2.21-68 EncodeVehicleStatusFAAD Information.

2.21.1.21.2 DecodeVehicleStatusM2

Decode Vehicle Status M2 decodes an M2 Vehicle Specific Status structure into a form supplied to the SCC Macintosh. The function call is Decode Vehicle Status M2 (vss, loc). Table 2.21-69 describes the parameters used by this function.

Parameters		
Parameter	Type	Where Typedef Declared
vss	pointer to VehicleSpecificStatus	/simnet/common/include/prot ocol/status.h
loc	pointer to SimVehicleStatus	/simnet/mcc/include/sim_xact. h
	Called By	
Function	Where Described	
ProcessSimQueryRequest	See Section 2.21.1.25.4.	

Table 2.21-69 DecodeVehicleStatusM2 Information.

2.21.1.21.3 TotalFuelM2

TotalFuelM2 adds up the fuel aboard an M2. *fuel* gets the amount of total fuel. The function call is TotalFuelM2(vss, fuel). Table 2.21-70 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
vss	pointer to VehicleSpecificStatus	/simnet/common/include/prot ocol/status.h
fuel	pointer to float	Standard C type.
	Called By	
Function	Where Described	
TotalVehicleFuel	See Section 2.21.1.28.1.	

Table 2.21-70 TotalFuelM2 Information.

2.21.1.21.4 m2_encode_failures

m2_encode_failures fills in the error bits for the failures. The function call is m2_encode_failures(vehicle_status). Table 2.21-71 describes the parameters used by this function.

Parameters		
Parameter	Type	Where Typedef Declared
vehicle_status	pointer to VehicleStatus	/simnet/common/include/prot ocol/status.h
	Calls	
Function	Where Described	
veh_subsys_encode_ground _failures		
	Called By	
Function	Where Described	
ProcessSimInitRequest	See Section 2.21.1.25.2.	·

Table 2.21-71 m2_encode_failures Information.

2.21.1.22 net.c

/simnet/mcc/libmcc/net.c

Each MCC host process must obtain a data pathway to the network adapter unit upon initialization. Upon successful termination, each process relinquishes the resources used by the data path. net.c provides routines to open and close the data path. Table 2.21-72 describes the variables used by net.c.

Variables		
Variable	Туре	Where Typedef Declared
g_ethernet_two_packets	int	Standard C type.
hdr	NetworkHeader	/simnet/libsrc/libnetif/network.
networkInterface	int	Standard C type.

Table 2.21-72 net.c Variable Information.

2.21.1.22.1 SAF NET SND KLUDGE

SAF_NET_SND_KLUDGE allows the MCC to send out either Ethernet 2.0 or Ethernet 802.3 packets. The function call is SAF_NET_SND_KLUDGE(h, to, buf, len, flags). Table 2.21-73 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
h	int	Standard C type.
to	pointer to NetworkAddress	/simnet/libsrc/libnetif/network.
buf	pointer to char	Standard C type.
len	int	Standard C type.
flags	int	Standard C type.
	Return Values	
Return Value	Туре	Meaning
net_snd(h, to, buf, len, flags)	int	send Ethernet 2.0 packets.
net_send(h, &hdr, buf, len, flags)	int	send Ethernet 802.3 packets.
	Calls	
Function	Where Described	
net_snd	See Section 2.20.2.19.2.	
net_send	See Section 2.20.2.15.1.	

Table 2.21-73 SAF_NET_SND_KLUDGE Information.

2.21.1.22.2 set g ethernet two packets

set_g_ethernet_two_packets set g_ethernet_two_packets to TRUE. The function call is set_g_ethernet_two_packets(). This function calls only standard functions and is not called by any other function in this library, so no table is included for it.

2.21.1.22.3 OpenNetworkInterface

OpenNetworkInterface obtains access to the simulation Ethernet. The function call is OpenNetworkInterface(topLevel). Table 2.21-74 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
topLevel	int	Standard C type.
	Calls	
Function	Where Described	
AssocOpen	See Section 2.20.1.5.1.	
MCC_SystemError	See Section 2.21.1.11.3.	
AssocError	See Section 2.20.1.10.1.	
AssocAttach	See Section 2.20.1.5.2.	
	Called By	
Function	Where Described	
InitializeProcess	See Section 2.21.1.19.1.	······································

Table 2.21-74 OpenNetworkInterface Information.

2.21.1.22.4 CloseNetworkInterface

CloseNetworkInterface releases access to the simulation Ethernet. The function call is CloseNetworkInterface(). Table 2.21-75 describes the functions called using this function.

Calls		
Function Where Described		
net_close See Section 2.20.2.3.1.		

Table 2.21-75 CloseNetworkInterface Information.

2.21.1.23 radio.c

/simnet/mcc/libmcc/radio.c

Radio power control to MCC controlled TOC radios is controlled through this module. Radios are currently not controlled by fielded MCC systems.

2.21.1.23.1 InitRadios

InitRadios initializes all radios to "off". The function call is InitRadios(). Table 2.21-76 describes the internal variables used and functions called using this function.

	Internal Variab	les
Variable	Type	Where Typedef Declared
bitmask	array of 9 char	Standard C type.
temp	register short	Standard C type.
i	register short	Standard C type.

Calls	
Function Where Described	
bbd_init	See Section 2.1.5.1.11.1 in the Vehicles CSCI.

Table 2.21-76 InitRadios Information.

2.21.1.23.2 RemoveRadios

RemoveRadios uninitializes the radio power control. The function call is RemoveRadios(). Table 2.21-77 describes the functions called using this function.

Calls		
Function	Where Described	
bbd_uninit	See Section 2.1.5.1.16.1 in the Vehicles CSCI.	

Table 2.21-77 RemoveRadios Information.

2.21.1.23.3 TurnRadioOn

TurnRadioOn turns on radio. The function call is TurnRadioOn(radio). Table 2.21-78 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedet Declared
radio	short	Standard C type.
	Calls	
<u> </u>		
Function	Where Described	
bbd bit out	See Section 2.1.5.1.4.1 in the Vehicles CSCI.	

Table 2.21-78 TurnRadioOn Information.

2.21.1.23.4 TurnRadioOff

TurnRadioOff turns off *radio*. The function call is TurnRadioOff(radio). Table 2.21-79 describes the parameters used and functions called using this function.

Parameters			
Parameter	Type	Where Typedef Declared	
radio	short	Standard C type.	
	Calls		
Function	Where Describe	d	
bbd bit out	See Section 2.1.5.1	.4.1 in the Vehicles CSCI.	

Table 2.21-79 TurnRadioOff Information.

2.21.1.24 segintr.c

/simnet/mcc/libmcc/segintr.c

segintr.c contains functions which determine if a line segment crosses or touches inappropriately (i.e. in the middle) any of an array of previous line segments.

2.21.1.24.1 seg_intrsct

seg_intrsct computes information on the intersection of a line segment from pt_0p topt_1p with the (connected) line segments $pt_arr[0]$ topt_arr[num_pts - 1]. It requires that num_pts is greater than 2. For computing points of intersection, paramsp->size_out_ptsp should be at least 2 (or 1 more than you expect), in case of segment overlap. The function call is seg_intrsct(paramsp). Table 2.21-80 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
paramsp	pointer to segintparams	/simnet/mcc/libmcc/segintr.h
**************************************	Internal Variables	
Variable	Туре	Where Typedef Declared
use_x	register int	Standard C type.
x_diff	register int	Standard C type.
y_diff	register int	Standard C type.
i	register int	Standard C type.
slope	register double	Standard C type.
code	register int	Standard C type.
abort_code	register int	Standard C type.
nu.n_code	register int	Standard C type.
	Return Values	
Return Value	Type	Meaning
code	int	The segment intersection code describing the type of intersection.
DUMLIY	int	Not a valid segment.
	Calls	
Function	Where Described	
check_x_ints	See Section 2.21.1.24.2.	
reverse_param	See Section 2.21.1.24.4.	
check_y_ints	See Section 2.21.1.24.3.	

Table 2.21-80 seg intrsct Information.

2.21.1.24.2 check_x_ints

check_x_ints checks for an intersection of the finite line segments: ptp to pt_0p (with slope (dy/dx) assumed between -1 and 1) and pt_1p to pt_2p . The function call is check_x_ints(pt0p, pt1p, slope, pt2p, pt3p, outcode, outp, outp2, numoutp). Table 2.21-81 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
pt0p	pointer to Long_Point	/simnet/mcc/libmcc/segintr.h
pt1p	pointer to Long Point	/simnet/mcc/libmcc/segintr.h
slope	double	Standard C type.
pt2p	pointer to Long Point	/simnet/mcc/libmcc/segintr.h
pt3p	pointer to Long Point	/simnet/mcc/libmcc/segintr.h
outcode	int	Standard C type.
outp	pointer to coded_lpoint	/simnet/mcc/libmcc/segintr.h
out2p	pointer to coded_point	/simnet/mcc/libmcc/segintr.h
numoutp	pointer to int	Standard C type.
Патковр	pointer to int	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
p leftp	pointer to Long Poin t	/simnet/mcc/libmcc/segintr.h
p_rightp	pointer to Long Point	/simnet/mcc/libmcc/segintr.h
p1_leftp	pointer to Long Point	/simnet/mcc/libmcc/segintr.h
p1_rightp	pointer to Long Point	/simnet/mcc/libmcc/segintr.h
dist1	double	Standard C type.
dist2	double	Standard C type.
delta x	double	Standard C type.
slope2	double	Standard C type.
	Return Values	
Deturn Value		Interning
Return Value	Type	Meaning
ON_ONE_SIDE	int	The segments miss; separated by x or y.
BOTH_ON_LINE_ABUTTING	int	The given segment is colinear
BOTT_ON_EINE_ABOTTING	""	to another and the vertices
	i	touch.
BOTH ON LINE OVERLAP	int	The segments are colinear
PING		and the vertices do not touch
ON_LINE TO SIDE	int	A vertex is on an extended
0.77	· · · ·	line, but not on the segment;
	·	there is no intersection.
ON LINE ABUTTING	int	One pair of vertices touch
ON_LINE_MID_TOUCH	int	One vertex touches the
		middle of the given semgnet
MID CROSS	int	The line segments cross in the
		middle.
ABUTTING	int	The given segment is abutted
	<u> </u>	by the other.

Function	Where Described	
seg_intrsct	See Section 2.21.1.24.1.	

Table 2.21-81 check_x_ints Information.

2.21.1.24.3 check_y_ints

check_y_ints checks for an intersection of the finite line segments: ptp to pt_0p (with slope (dy/dx) assumed between -1 and 1) and pt_1p topt_2p. The function call is check_y_ints(pt0p, pt1p, slope, pt2p, pt3p, outcode, outp, outp2, numoutp). Table 2.21-82 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
pt0p	pointer to Long_Point	/simnet/mcc/libmcc/segintr.h
pt1p	pointer to Long Point	/simnet/mcc/libmcc/segintr.h
slope	double	Standard C type.
pt2p	pointer to Long_Point	/simnet/mcc/libmcc/segintr.h
pt3p	pointer to Long Point	/simnet/mcc/libmcc/segintr.h
outcode	int	Standard C type.
outp	pointer to coded_lpoint	/simnet/mcc/libmcc/segintr.h

Table 2.21-82 check_y_ints Information.

2.21.1.24.4 reverse_param

reverse_param reverses the x and y coordinates for all member points in the paramp parameter. Member points include pt0p, pt1p, the points in the pt_arr array, and the points in the outptsp array. The function call is reverse_param(paramp). Table 2.21-83 describes the parameters used and functions called using this function.

Parameters			
Parameter	Type	Where Typedef Declared	
paramp	pointer to segintparams	/simnet/mcc/libmcc/segintr.h	
	Internal Variables		
Variable	Type	Where Typedef Declared	
i	register int	Standard C type.

Function	Where Described		
seg_intrsct	See Section 2.21.1.24.1.		

Table 2.21-83 reverse param Information.

2.21.1.25 sim.c

/simnet/mcc/libmcc/sim.c

sim.c contains code used by the SCC and Placement console processes for placing simulators. It provides the following functions:

- information about simulators available for the exercise;
- requests to place or reconstitute a simulator's vehicle;
- handles requests for the status of a vehicle to be reconstituted; and
- notifies consoles when a requested activation has failed.

2.21.1.25.1 ProcessSimExistsRequest

ProcessSimExistsRequest processes a request for simulator data from a Mac. The function call is ProcessSimExistsRequest(t). Table 2.21-84 describes the parameters used, internal variables used, and functions called by using this function.

Parameters		
Parameter	Type	Where Typedef Declared
t	pointer to Transaction	/simnet/mcc/include/bridge.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
req	pointer to SimExistsRequest	/simnet/mcc/include/sim_xact. h
rsp	register pointer to SimExistsResponse	/simnet/mcc/include/sim_xact. h
sim	register pointer to SimulatorStatus	/simnet/mcc/include/veh_table.h
	Calls	
Function	Where Described	
ATPRequestData	Macro defined in /simnet/mcc/include/bridge.h.	
SendConsoleResponse	See Section 2.21.1.7.6.	
GetOldStyleCompany	See Section 2.21.1.25.6.	

Table 2.21-84 ProcessSimExistsRequest Information.

2.21.1.25.2 ProcessSimInitRequest

ProcessSimInitRequest processes a request to place a vehicle from a Mac. vehiclePtr is set to the number of the vehicle activated. The function call is ProcessSimInitRequest(t, vehiclePtr). Table 2.2-85 describes the parameters used, internal variables used, and functions called by using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
t	pointer to Transaction	/simnet/mcc/include/bridge.h
vehiclePtr	pointer to int	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
req	register pointer to SimInitRequest	/simnet/mcc/include/sim_xact. h
rsp	pointer to SimInitResponse	/simnet/mcc/include/sim_xact. h
vehicle	unsigned short	Standard C type
msg	MCCMessageBuffer	/simnet/mcc/include/MCC_ipc .h
rspKind	long	Standard C type
errCode	int	Standard C type.
rspLen	int	Standard C type
sim	register pointer to SimulatorStatus	/simnet/mcc/include/veh_table.h

Return Values			
Return Value	Type	Meaning	
1	int	Successful	
0	int	Unsuccessful	
	Calls		
Function	Where Described		
ATPRequestData	Macro defined in /simnet	/mcc/include/bridge.h.	
InitUnit	See Section 2.21.1.19.4.		
GetGuises	See Section 2.21.1.17.1.

Table 2.21-85 ProcessSimInitRequest Information.

2.21.1.25.3 SimGetSimType

SimGetSimType translates a vehicle object code into a SIMNET simulator type. The function call is SimGetSimType(vehicle_object_type). Table 2.21-86 describes the parameters used by this function.

	Parameters	
Parameter	Type	Where Typedef Declared
vehicle_object_type	ObjectType	/simnet/common/include/prot ocol/basic.h
	Datum Values	
	Return Values	
Return Value	Type	Meaning
simulator_SIMNET_M1	SimulatorType	The simulator is an M1.
simulator_SIMNET_M2	SimulatorType	The simulator is an M2.
simulator_SIMNET_FRED	SimulatorType	The simulator is a FRED.
0	SimulatorType	Unknown simulator type.
	Called By	· · · · · · · · · · · · · · · · · · ·
Function	Where Described	
ProcessSimQueryRequest	See Section 2.21.1.25.4.	

Table 2.21-86 SimGetSimType Information.

2.21.1.25.4 ProcessSimQueryRequest

ProcessSimQueryRequest responds to a request from a Macintosh for the current status of a vehicle simulator. The function call is ProcessSimQueryRequest(t). Table 2.21-87 describes the parameters used, errors returned and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
t	pointer to Transaction	/simnet/mcc/include/bridge.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
req	pointer to SimQueryRequest	/simnet/mcc/include/sim_xact. h
rsp	pointer to SimQueryResponse	/simnet/mcc/include/sim_xact. h
sim	pointer to SimulatorStatus	/simnet/mcc/include/veh_table.h
veh	pointer to VehicleIDStatus	/simnet/mcc/include/veh_table.h
veh_status	pointer to VehicleStatus	/simnet/common/include/prot ocol/status.h
turretAzimuth	Angle	/simnet/common/include/prot ocol/basic.h
vehicleType	unsigned short	Standard C type.
rollPitchYaw	array of 3 float	Standard C type.
appear	pointer to VehicleAppearanceVariant	/simnet/common/include/prot ocol/p_sim.h
	Farana	
Error Name	Errors Reason for Error	
MCC_UNKNOWN_VEHICLE_ TYPE	Unknown vehicle type.	
	Calls	
Function	Where Described	
ATPRequestData	Macro defined in /simnet/mcc/include/bridge.h.	
SimGetSimType	See Section 2.21.1.25.3.

Unlock	See Section 2.21.2.6.4.	

Table 2.21-87 ProcessSimQueryRequest Information.

2.21.1.25.5 GetCompanyFromOrg

GetCompanyFromOrg returns the company, given the organizational unit. The function call is GetCompanyFromOrg(organization). Table 2.21-88 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
organization	pointer to OrganizationalUnit	/simnet/common/include prot ocol/basic.h
	Return Values	
		
Return Value	Туре	Meaning
organization ->hierarchy [companyOrgLevel].unitNumb er	char	the company unit.
	Called By	
Franklan		
Function	Where Described	
GetOldStyleCompany	See Section 2.21.1.25.6.	_

Table 2.21-88 GetCompanyFromOrg Information.

2.21.1.25.6 GetOldStyleCompany

GetOldStyleCompany returns a company constant in the old protocol. The function call is GetOldStyleCompany(unit). Table 2.21-89 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
unit	pointer to OrganizationalUnit	/simnet/common/include/glob al/basic.h
	Internal Variables	
Variable	Type	Where Typedef Declared
company	char	Standard C type.
GetCompanyFromOrg()	extern char	See Section 2.21.1.25.5.
	Return Values	
Return Value	Type	Meaning
company	char	
assignedScoutPlt	char	
assignedBattalion	char	
assignedTACP	char	
assignedNothing	char	
	Calls	
Function	Where Described

Function	Where Described	
ProcessSimExistsRequest	See Section 2.21.1.25.1.	

Table 2.21-89 GetOldStyleCompany Information.

2.21.1.25.7 PutCompanyInSim

PutCompanyInSim assigns a company to a simulator. The function call is PutCompanyInSim(sim, company). Table 2.21-90 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
sim	pointer to SimulatorStatus	/simnet/mcc/include/veh_table.h
company	unsigned char	Standard C type.

Table 2.21-90 PutCompanyInSim Information.

2.21.1.26 spawn.c

/simnet/mcc/libmcc/spawn.c

spawn.c provides for mechanisms to control and coordinate activity and initializing communications between parent and child processes in the host MCC and for terminating communications upon exit. Table 2.21-91 describes the variables used by spawn.c.

	Variables	
Variable	Туре	Where Typedef Declared
errno	extern int	Standard C type.

Table 2.21-91 spawn.c Variable Information.

2.21.1.26.1 SpawnProcess

SpawnProcess forks an MCC process, p. The function call is SpawnProcess(p). Table 2.21-92 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
р	int	Standard C type.
	Internal Variable	es
Variable	Туре	Where Typedef Declared
pid	int	Standard C type.
mypid	int	Standard C type.
target_dir	array of 30 char	Standard C type.
	Calls	
Function	Where Described	
MCC_SystemError	See Section 2.21.1.11.	3.

Table 2.21-92 SpawnProcess Information.

2.21.1.26.2 LookupProcessIdentifier

LookupProcessIdentifier gets a process number from a process ID, pid. The function call is LookupProcessIdentifier(pid). Table 2.21-93 describes the parameters used by this function.

	Paramete	ers
Parameter	Type	Where Typedef Declared
pid	int	Standard C type.
	Internal Var	ables
Variable	Туре	Where Typedef Declared
p	int	Standard C type.
	Return Va	lues
Return Value	Type	Meaning
р	int	Process number.
0	int	Unsuccessful.

Table 2.21-93 LookupProcessIdentifier Information.

2.21.1.26.3 LookupProcessNumber

LookupProcessNumber gets a process ID from a process number, p. The function call is LookupProcessNumber(p). Table 2.21-94 describes the parameters used by this function.

	Paramete	ers
Parameter	Type	Where Typedef Declared
Р	int	Standard C type.
	Return Val	lues
Return Value	Type	Meaning
mcc->pInfo[p].pid	int	Process ID

Table 2.21-94 LookupProcessNumber Information.

2.21.1.26.4 SignalChild

SignalChild sends a signal ato a child process, p. The function call is SignalChild(p, s). Table 2.21-95 describes the parameters used and functions called using this function.

	Paramet	ers
Parameter	Туре	Where Typedef Declared
Р	int	Standard C type.
S	int	Standard C type.

Table 2.21-95 SignalChild Information.

2.21.1.27 time.c /simnet/mcc/libmcc/time.c

time.c contains a routine for converting between Macintosh and Masscomp Unix style time. Table 2.21-96 describes the variables used by time.c.

Variables		
Variable	Type	Where Typedef Declared
localtime()	extern pointer to struc tm	Standard C Library.
time()	extern long	Standard C Library.
tzset()	extern void	Standard C Library.
timezone	extern long	Standard C Library.
daylight	extern int	Standard C Library.

Table 2.21-96 time.c Variable Information.

2.21.1.27.1 MacintoshTime

Macintosh Time returns current local time in Macintosh format. UNIX_TO_MAC is a constant which accounts for the difference between Macintosh time zero (Jan. 1, 1904) and Unix time zero (Jan. 1, 1970). The function call is Macintosh Time(). Table 2.21-97 describes the internal variables used and return values generated by using this function.

	Internal Variables	
Variable	Туре	Where Typedef Declared
Itime	pointer to struct tm	Standard C library
gtime	long	Standard C type.
dst	long	Standard C type.
	Return Values	
Return Value	Type	Meaning
gtime + UNIX_TO_MAC - timezone + dst	long	Current local time in Macintosh format.
	Calls	
Function	Where Described	
tzset	Standard C Library.	
time	Standard C Library.	
localtime	Standard C Library.	
	Called By	
Function	Where Described	
ActivateConsole	See Section 2.21.1.7.2.	

Table 2.21-97 MacintoshTime Information.

2.21.1.28 total.c

/simnet/mcc/libmcc/total.c

Tallying module responsible for computing the total amount of fuel on board a vehicle given a vehicle status packet. This module dispatches the appropriate tallying routine for simulator specific fuel loads.

2.21.1.28.1 TotalVehicleFuel

TotalVehicleFuel computes the total fuel on board a vehicle, given a VehicleStatus structure from that vehicle. The function call is TotalVehicleFuel(status, fuel). Table 2.21-98 describes the parameters used and fuctions called by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
status	register pointer to VehicleStatus	/simnet/common/include/prot ocol/status.h
fuel	pointer to float	Standard C type.
	Calls	
Function	Where Described	
TotalFuelM1	See Section 2.21.1.20.3.	
TotalFuelM2	See Section 2.21.1.21.3.	
TotalFuelGeneric	See Section 2.21.1.15.1.	

Table 2.21-98 Total Vehicle Fuel Information.

2.21.1.29 truck.c

/simnet/mcc/libmcc/truck.c

Status information about computer controlled vehicles acting as supply trucks are stored as a table in shared memory. truck.c acts as the interface between MCC host services manipulating truck resources and the table of truck parameters.

2.21.1.29.1 GetTruckParameters

GetTruckParameters finds the TruckParameters object in shared memory corresponding to a particular service truck. The function call is GetTruckParameters(capabilities, organization, truckNumber). Table 2.21-99 describes the parameters used, errors returned and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
capabilities	pointer to VehicleCapabilities	/simnet/common/include/prot ocol/basic.h
organization	pointer to OrganizationalUnit	/simnet/common/include/prot ocol/basic.h
truckNumber	short	Standard C type.

	Internal Variables	
Variable	Туре	Where Typedef Declared
pars	register pointer to TruckParameters	/simnet/mcc/include/MCC_par s.h
	Return Values	
Return Value	Туре	Meaning
pars+truckNumber	pointer to TruckParameters	the TruckParameters object in shared memory corresponding to the truck specified by truckNumber.
	Errors	
Error Name	Reason for Error	· · · · · · · · · · · · · · · · · · ·
MCC TRUCK BADPARM	Invalid truck parameter.	

Table 2.21-99 GetTruckParameters Information.

2.21.1.30 vehsubsys.c

/simnet/mcc/libmcc/vehsubsys.c

vehsubsys.c contains functions which fill in the vehicle subsystem failure bits.

2.21.1.30.1 fill_bytes

fill_bytes fills in *data* with *fill_value*. The function call is fill_bytes(data, fill_value, size). Table 2.21-100 describes the parameters used by this function.

	Parameters	
Parameter	Type	Where Typedef Declared
data	pointer to char	Standard C type.
fill_value	char	Standard C type.
size	int	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
i	int	Standard C type.
	Called By	
Function	Where Described	
veh_subsys_encode_ground _failures	See Section 2.21.1.30.2.	
veh_subsys_encode_air_failu res	See Section 2.21.1.30.3.	

Table 2.21-100 fill_bytes Information.

2.21.1.30.2 veh_subsys_encode_ground_failures

veh_subsys_encode_ground_failures fills in the ground vehicle subsystems failure bits with the appropriate codes. The function call is veh_subsys_encode_ground_failures(failures). Table 2.21-101 describes the parameters used and functions called using this function.

Parameters			
Parameter	Type	Where Typedef Declared	
failures	pointer to VehicleSubsystems	/simnet/common/include/prot ocol/status.h	
<u> </u>	Internal Variables		
Variable	Type	Where Typedef Declared	
ground	pointer to GroundVehicleSubsystems	/simnet/common/include/prot ocol/status.h	
	Calls		
Function	Where Described		
fill_bytes	See 2.21.1.30.1.

fred_encode_failures	See Section 2.21.1.14.3.	

Table 2.21-102 veh_subsys_encode_air_failures Information.

2.21.1.31 widebdry.c

/simnet/mcc/libmcc/widebdry.c

widebdry.c contains a function which allocates an array of boundary vertices from a sequence of points.

2.21.1.31.1 wide_bdry

wide_bdry allocates an array of boundary vertices (bdry_vertsp), given a sequence of points center_verts[0] to center_verts[num_cverts - 1] created by the caller. The caller must later free the array. The number of valid boundary points in the array is num_bvertsp. If the center_verts form a path that crosses or touches itself, the path from the boundary vertices will likely cross itself. The function call is wide_bdry(center_verts, num_cverts, width, bdry_vertsp, num_bvertsp). Table 2.21-103 describes the parameters used and functions called using this function.

	Parameters		
Parameter	Туре	Where Typedef Declared	
center_verts	pointer to Long Point	/simnet/mcc/libmcc/segintr.h	
num_cverts	int	Standard C type.	
width	int	Standard C type.	
bdry_vertsp	pointer to pointer to Long_Point	/simnet/mcc/libmcc/segintr.h	
num_bvertsp	pointer to int	Standard C type.

Table 2.21-103 wide_bdry Information.

2.21.1.32 MCC errs.err

/simnet/mcc/libmcc/MCC_errs.err

This file defines the severity, name, and textual messages associated with abnormal conditions detected by the MCC host system. The exceptions defined herein are dispatched to the standard exception handler which is then free to attempt to deal with the exception in an appropriate manner, if any.

2.21.1.33 MCC errs.c /simnet/mcc/libmcc/MCC errs.c

MCC_errs.c is an error definition file generated by errcom. Table 2.21-104 describes the variables used by MCC_errs.c.

Variables		
Variable	Туре	Where Typedef Declared
errfacs	extern array of MAXFACILITIES ERRFACS	
MCC_errlist	pointer to array of char	Standard C type.
MCC_errinfo	array of ERRINFO	

Table 2.21-104 MCC errs.c Variable Information

2.21.1.33.1 MCC_errinit

MCC_errinit is the error initialization routine for the MCC facility. The function call is MCC_errinit(). Table 2.21-105 describes the functions which call MCC_errinit.

Called By		
Function Where Described		
InitErrorHandling	See Section 2.21.1.11.1.	
mccerrinit_	See Section 2.21.1.33.2.	

Table 2.21-105 MCC errinit Information.

2.21.1.33.2 mccerrinit

mccerrinit_ is the fortran entry point to the error initialization routine for the MCC facility. The function call is mccerrinit-(). Table 2.21-106 describes the functions called by this function.

Calls		
Function	Where Described	
MCC_errinit	See Section 2.21.1.33.1.	

Table 2.21-106 mccerrinit Information.

2.21.2 libipc

Interprocess Communication Package

Libipc provides several discrete services related to interprocess communication. The services provided are:

- Queued, time based alarm events (alarm.*);
- Shared memory management (memory.*);
- A semaphore based mutual exclusion mechanism (lock.*); and
- Transaction and datagram interprocess message services (yumm*.*).

Libipc is used to coordinate activity across the distributed process of the MCC system.

2.21.2.1 ipc.h

/simnet/rcs/libipc/ipc.h

ipc.h defines the functions available in the IPC library. Table 2.21-107 describes the variables used by ipc.h.

Variables			
Variable	Туре	Where Typedef Declared	
ipc_mem_errno	extern int	Standard C type.	

Table 2.21-107 ipc.h Variable Information

2.21.2.2 keys.h

/simnet/rcs/libipc/keys.h

keys.h defines keys that uniquely identify shared memory segments, groups of semaphores and message queues all used for inter-process communication.

2.21.2.3 alarm.h

/simnet/rcs/libipc/alarm.h

alarm.h is the header file associated with alarm.c (see Section 2.21.2.4).

2.21.2.4 alarm.c

/simnet/rcs/libipc/alarm.c

alarm.c contains routines which provide an alarm service similar to that of the alarm(2) system call, but differing in that multiple alarms can be pending. Table 2.21-108 describes the variables used by alarm.c.

Variables			
Variable Type Where Typedef Decla			
alarmSchedule	Alarm	/simnet/rcs/libipc/alarm.h	
alarmsEnabled	int	Standard C type	

Table 2.21-108 alarm.c Variable Information.

2.21.2.4.1 InitAlarms

InitAlarms initializes the alarm package. The function call is InitAlarms(). Table 2.21-109 describes the functions called using this function.

Calls		
Function	Where Described	
IPC_errinit	See Section 2.21.2.13.1.	

Table 2.21-109 InitAlarms Information.

2.21.2.4.2 SetAlarm

SetAlarm makes a new entry in the schedule of upcoming alarms. *delay* is how long to wait before alarm is due; *fnc* is a pointer to function call when alarm is due; *param* is the parameter to give the function when it is called. The function call is SetAlarm(delay, fnc, param). Table 2.21-110 describes the parameters used and errors returned using this function.

	Parameters		
Parameter	Туре	Where Typedef Declared	
delay	int	Standard C type.	
(fnc)()	pointer to int	Standard C type.	
param	long	Standard C type.	
	Internal Variabi	es	
Variable	Туре	Where Typedef Declared	
prevAlarm	unsigned	Standard C type.	
а	register Alarm	/simnet/rcs/libipc/alarm.h	
p1	register Alarm	/simnet/rcs/libipc/alarm.h	
p2	register Alarm	/simnet/rcs/libipc/alarm.h	
oldPriority	int	Standard C type.	
	Return Values		
Return Value	Туре	Meaning	
0	Alarm	Unsuccessful.	
a	Alarm	New alarm.	
L <u> </u>	Errors		
Error Name	Reason for Error		
IPC_ALARM_MEMORY	Not enough memory.		

Table 2.21-110 SetAlarm Information.

2.21.2.4.3 Cancel Alarm

CancelAlarm removes an entry, a, from the schedule of upcoming alarms. The function call is CancelAlarm(a). Table 2.21-111 describes the parameters used by this function.

Parameters		
Parameter	Type	Where Typedef Declared
a	register Alarm	/simnet/rcs/libipc/alarm.h

Internal Variables			
Variable	Type	Where Typedef Declared	
prevAlarm	unsigned	Standard C type.	
p1	register Alarm	/simnet/rcs/libipc/alarm.h	
p2	register Alarm	/simnet/rcs/libipc/alarm.h	
oldPriority	int	Standard C type.	

Table 2.21-111 CancelAlarm Information.

2.21.2.4.4 AlarmsEnabled

AlarmsEnabled enables or disables the alarm interrupts. The value returned is non-zero if and only if the alarms were enabled at the time of the call. The function call is AlarmsEnabled(on). Table 2.21-112 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
on	int	Standard C type.
	Internal Variab	les
Variable	Type	Where Typedef Declared
oldPriority	int	Standard C type.
oldAlarmsEnabled	int	Standard C type.
now	long	Standard C type.
a	register Alarm	/simnet/rcs/libipc/alarm.h
	Return Value	S
Return Value	Туре	Meaning
alarmsEnabled	int	No change in state.
oldAlarmsEnabled	int	Changed state of alarms.

Table 2.21-112 AlarmsEnabled Information.

2.21.2.4.5 DispatchAlarm

DispatchAlarm handles a SIGALARM signal by calling the next scheduled alarm client function. The function call is DispatchAlarm(sig). Table 2.21-113 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
sig	int	Standard C type
	Internal Variab	les
Variable	Туре	Where Typedef Declared
now	long	Standard C type.
а	register Alarm	/simnet/rcs/libipc/alarm.h
		Standard C type

Table 2.21-113 DispatchAlarm Information.

2.21.2.5 error.c /simnet/rcs/libipc/error.c

error.c contains a routine which reports an error encountered in a system call. Table 2.21-114 describes the variables used by error.c.

Variables			
Variable	Type	Where Typedef Declared	
errno	extern int	Standard C type.	
sys nerr	extern int	Standard C type.	
sys_errlist	extern pointer to array of char	Standard C type.	

Table 2.21-114 error.c Variable Information.

2.21.2.5.1 IPC SystemError

IPC_SystemError reports an error encountered in a system call. functionName is the name of the function you were in when the call was made and systemCallName is the name of the system call made. The function call is IPC_SystemError(functionName, systemCallName). Table 2.21-115 describes the parameters used by this function.

Parameters				
Parameter	Type	Where Typedef Declared		
functionName	pointer to char	Standard C type.		
systemCallName	pointer to char	Standard C type.		
	Internal Variables			
Variable	Туре	Where Typedef Declared		
S	pointer to char	Standard C type.		
str	array of 10 char	Standard C type.		
	Called By			
Function	Where Described			
AttachLocks	See Section 2.21.2.6.1.			
ResetLocks	See Section 2.21.2.6.2.			
Lock	See Section 2.21.2.6.3.			
Unlock	See Section 2.21.2.6.4.			
RemoveLocks	See Section 2.21.2.6.5.			
AttachMsgQueue	See Section 2.21.2.8.1.			
RemoveMsgQueue	See Section 2.21.2.8.2.

Transact	See Section 2.21.2.10.9.			
RcvMsg	See Section 2.21.2.12.1.			
SendData	See Section 2.21.1.12.3.			

Table 2.21-115 IPC_SystemError Information.

2.21.2.6 lock.c /simnet/rcs/libipc/lock.c

lock.c contains routines which implement exclusive-access locks using semaphores. Table 2.21-116 describes the variables used by lock.c.

Variables			
Variable	Туре	Where Typedef Declared	
errno	extern int	Standard C type.	

Table 2.21-116 lock.c Vriable Information.

2.21.2.6.1 AttachLocks

AttachLocks gets a group of semaphores to use as locks. If the group has not yet been created, it is created at this time. key is the key for the semaphores, n is the number of semaphores and first is returned TRUE if the semaphore group was created. This function is not good for checking if a key is already in use. No error will be returned, just the semaphore id. The function call is AttachLocks(key, n, first). Table 2.21-117 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
key	int	Standard C type.
n	int	Standard C type.
first	pointer to int	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
semid	int	Standard C type.
firstFlag	int	Standard C type.
	Return Values	
Return Value		Mooning
	Туре	Meaning
semid	int	Semaphore id.
	Calls	
Function	Where Described	
IPC_errinit	See Section 2.21.2.13.1.	
IPC_SystemError	See Section 2.21.2.5.1.	
ResetLocks	See Section 2.21.2.6.2.	
	Colled P:	
Function	Called By	
Function	Where Described	
YUMMInit	See Section 2.21.2.10.1.	

Table 2.21-117 AttachLocks Information.

2.21.2.6.2 ResetLocks

ResetLocks initializes a group of semaphores representing locks. semid is semaphore id and n is the number of semaphores in the group. The function call is ResetLocks(semid, n). Table 2.21-118 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
semid	int	Standard C type.	
n	int	Standard C type.	
	Internal Variable	es	
Variable	Type	Where Typedef Declared	
i	int	Standard C type.	
	Calls		
Finalian			
Function	Where Described		
IPC_SystemError_	See Section 2.21.2.5.1	<u> </u>	
	Called By		
Function	Where Described

CloseSocket	See Section 2.21.2.10.4.		
OpenSocket	See Section 2.21.2.10.3.		

Table 2.21-119 Lock Information.

2.21.2.6.4 Unlock

Unlock unlocks a shared resource. The function call is Unlock(semid, n). Table 2.21-120 describes the parameters used and functions called using this function.

Parameters				
Parameter	Туре	Where	Typedef	Declared
semid	int	Standar	d C type.	
<u>n</u>	int	Standard	d C type.	
	Internal Variables			
Variable	Type	Where	Typedef	Declared
sop	struct sembuf		.,,,,,,	
	Calls			
Function	Where Described			
IPC_SystemError	See Section 2.21.2.5.1.			
	Called By		_	
Function	Where Described			
GetInternProcID	See Section 2.21.2.12.7.			
CloseSocket	See Section 2.21.2.10.4.			
OpenSocket	See Section 2.21.2.10.3.			

Table 2.21-120 Unlock Information.

2.21.2.6.5 RemoveLocks

RemoveLocks removes a group of semaphores, described by key, from the system. The function call is RemoveLocks(key). Table 2.21-121 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
key	int	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
semid	int	Standard C type.
	Calls	
Function	Where Described	
IPC_SystemError	See Section 2.21.2.5.1.	

Table 2.21-121 RemoveLocks Information.

2.21.2.7 memory.c /simnet/rcs/libipc/memory.c

memory.c contains routines for managing the memory shared among processes. Table 2.21-122 describes the variables used by memory.c.

	Variables	
Variable	Type	Where Typedef Declared
ipc_mem_errno	int	Standard C type.
errno	extern int	Standard C type

Table 2.21-122 memory.c Variable Information.

2.21.2.7.1 AttachSharedMem

AttachSharedMem attaches to memory shared among processes. When it is getting the memory, it figures out if this process is the first one to get it and returns so that some initialization can take place. key is the key for the shared memory and size is the size of the memory. first returns TRUE if this is the first process to create shared memory. This process cannot be used to determine if key is already in use. It can only return the shared memory id. The function call is AttachSharedMem(key, size, first). Table 2.21-123 describes the parameters used, errors returned and functions called using this function.

Parameters			
Parameter	Type	Where Typedef Declared	
key	int	Standard C type.	
size	int	Standard C type.	
first	pointer to int	Standard C type.	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
shmat	extern array of char	Standard C type.	
sbrk	extern array of char	Standard C type.	
id	int	Standard C type.	
charp	pointer to char	Standard C type.	
	Return Values		
Return Value	Type	Meaning	
0	pointer to char	Unsuccessful. Check	
		ipc_mem_errno for error code.	
charp	pointer to char	Pointer to shared memory.	
	Errors		
Error Name	Reason for Error	<u> </u>	
IPC_SHMEM_SBRK	Couldn't grow process.	Couldn't grow process.	
IPC_SHMEM_BRK	Couldn't grow process.		
IPC_SHMEM_SHMGET	Couldn't get region.		
IPC_SHMEM_SHMAT	Couldn't attach to region.		
	6-11-		
EuroAlon	Calls		
Function	Where Described

	Called By
Function	Where Described
YUMMInit	See Section 2.21.2.10.1.

Table 2.21-123 AttachSharedMem Information.

2.21.2.7.2 RemoveSharedMem

RemoveSharedMem removes a block of shared memory, described by key and address, from the system. The function call is RemoveSharedMem(key, address). Table 2.21-124 describes the parameters used and errors returned by this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
key	int	Standard C type.	
address	pointer to char	Standard C type.	
	Internal Variables	 	
Variable	Туре	Where Typedef Declared	
shmid	int	Standard C type.	
	Return Values		
Return Value	Туре	Meaning	
-1	int	Unsuccessful.	
	Errors		
Error Name	Reason for Error		
IPC_SHMEM_RM_SHMGET			
IPC_SHMEM_SHMDT	Couldn't delete the region.		
IPC_SHMEM_SHMCTL	Couldn't remove the region.		

Table 2.21-124 RemoveSharedMem Information.

2.21.2.8 msgqueue.c

/simnet/rcs/libipc/msgqueue.c

msgqueue.c contains routines to create, attach and remove a message queue. Table 2.21-125 describes the variables used by msgqueue.c.

	Variables	
Variable	Type	Where Typedef Declared
errno	extern int	Standard C type.

Table 2.21-125 msgqueue.c Variable Information.

2.21.2.8.1 AttachMsgQueue

AttachMsgQueue is used to create a message queue and its ID or return the ID of an already existing message queue. key is the message queue key and first returns 1 if the message queue was created. This routine cannot be used to determine if key is already in use. It will just return the ID of the corresponding message queue. The function call is AttachMsgQueue(key, first). Table 2.21-126 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
key	int	Standard C type.
first	int	Standard C type.
	internal Variables	
Variable	Type	Where Typedef Declared
queuelD	int	Standard C type.
	Return Values	
Return Value	Туре	Meaning
queuelD	int	ID of message queue.
	Calls	
Function	Where Described	
IPC_errinit	See Section 2.21.2.13.1.	
IPC_SystemError_	See Section 2.21.2.5.1.	
	Called By	
Function	Where Described	
YUMMInit	See Section 2.21.2.10.1.	_

Table 2.21-126 AttachMsgQueue Information.

2.21.2.8.2 RemoveMsgQueue

RemoveMsgQueue removes the message queue associated with key. The function call is RemoveMsgQueue(key). Table 2.21-127 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
key	int	Standard C type.
·		
	Internal Variables	
Variable	Туре	Where Typedef Declared
msgQid	int	Standard C type.
	Calls	
Function	Where Described	
IPC_SystemError	See Section 2.21.2.5.1.	

Table 2.21-127 RemoveMsgQueue Information.

2.21.2.9 yumm.h /simnet/rcs/libipc/yumm.h

yumm.h is the external include file for YUMM. Programs using YUMM procedures need to include this file. Table 2.21-128 describes the variables used by this file.

Variables		
Variable	Type	Where Typedef Declared
YUMMSocket	unsigned char	Standard C type.

Table 2.21-128 yumm.h Variable Information.

2.21.2.10 yummextern.c /simnet/rcs/libipc/yummextern.c

yummextern.c contains all the external routines for YUMM (Yet Unother Message-passing Mechanism). Table 2.21-129 describes the variables used by yummextern.c.

Variables		
Variable	Type	Where Typedef Declared
errno	extern int	Standard C type.

Table 2.21-129 yummextern.c Variable Information.

2.21.2.10.1 YUMMInit

YUMMInit does the initialization for the system, if necessary, and for this process. It allocates and attaches a chunk of shared memory for the socket table, allocates and attaches the semaphore table and allocates and attaches a system-wide message queue. It also generates the internal process id. It returns nothing if everything is ok, or the system error if there is a problem. Warning: This procedure is NOT foolproof. If a non-YUMM related process already allocated shared memory, a semaphore group or a message queue with the same key as YUMM uses, havoc could result. Check keys.h. The function call is YUMMInit(). Table 2.21-130 describes the internal variable used and functions called using this function.

	Internal Variables	
Variable	Туре	Where Typedef Declared
first	int	Standard C type.
	Calls	
Function	Where Described	
AttachSharedMem	See Section 2.21.2.7.1.	
InitShMem	See Section 2.21.2.12.5.	
AttachLocks	See Section 2.21.2.6.1.	
AttachMsgQueue	See Section 2.21.2.8.1.	
IPC_errinit	See Section 2.21.2.13.1.	

Table 2.21-130 YUMMInit Information.

2.21.2.10.2 **YUMMProcess**

YUMMProcess initializes process specific information such as procid and the entry in the socket table for this process' synchronous requests. It also allocates the semaphore for this process. *procname* is the name of the process used to register a socket. The function call is YUMMProcess(procname). Table 2.21-131 describes the parameters used, errors returned and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
procname	pointer to char	Standard C type.
	Calls	
Function	Where Described	
CleanupDeadSockets	See Section 2.21.2.12.6.	
GetInternProcID	See Section 2.21.2.12.7.	·
SetUpSynchReq	See Section 2.21.2.12.8.	

Table 2.21-131 YUMMProcess Information.

2.21.2.10.3 OpenSocket

OpenSocket dynamically allocates a socket and fills in the entry using information which is passed in and information which it can figure out. It uses a semaphore to avoid resource conflicts. usrASTHdlr is a pointer to the user's AST handler, sktName is the name to associate with the socket (it can be no more than 31 characters), astprio is the priority the sendast should use for this AST, sktNum is the socket allocated, or NULL if we don't care to get it and usrTrace is a pointer to the debugging routine called when AST comes. The function call is OpenSocket(usrASTHdlr, sktName, astprio, sktNum, usrTrace). Table 2.21-132 describes the parameters used, errors returned and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
(usrASTHdlr)()	function that returns pointer to void	Standard C type.	
sktName	pointer to char	Standard C type.	
astprio	int	Standard C type.	
sktNum	pointer to YUMMSocket	/simnet/rcs/libipc/yumm.h	
(usrTrace)()	function that returns pointer to void	Standard C type.	
Variable	Internal Variables Type	Where Typedef Declared	
i	short	Standard C type.	
temp	YUMMSocket	/simnet/rcs/libipc/yumm.h	
	Return Values		
Return Value	Туре	Meaning	
0	short	Socket number allocated.	
-1	short	Socket number not allocated, error code returned in errno.	

. Errors		
Error Name	Reason for Error	
IPC_DUP_SOCKET_NAME	The current socket name is a duplicate of one already in the table.	
IPC SOCKET TABLE FULL	The socket table is full.	
	Calls	
Function	Where Described	
Lock	See Section 2.21.2.6.3.	
LkUpSocket	See Section 2.21.2.10.10.	
Unlock	See Section 2.21.2.6.4.	

Table 2.21-132 OpenSocket Information.

2.21.2.10.4 CloseSocket

CloseSocket closes the designated socket according to always. If always is TRUE it closes the socket no matter what, otherwise, it checks to see if there are outstanding requests on that socket before closing and it will not close if there are any. skinumber is the socket name of the entry to close. The function call is CloseSocket(skinumber, always). Table 2.21-133 describes the parameters used, errors returned and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
sktnumber	int	Standard C type.	
always	char	Standard C type.	
Maniah II	Internal Variables	Titte - Time dat Dadam d	
<u>Variable</u>	Туре	Where Typedef Declared	
<u> </u>	int	Standard C type.	
	Return Values		
Return Value	Туре	Meaning	
0	short	Successful.	
-1	short	Requests outstanding, check errno for error code.	
	Errors		
Error_Name		Reason for Error	
IPC_MORE_REQS	More requests for this socke	More requests for this socket are outstanding.	
	Calls		
Function	Where Described		
Lock	See Section 2.21.2.6.3.		
Unlock	See Section 2.21.2.6.4.		
	Called By		
Function	Where Described		
CleanupDeadSockets	See Section 2.21.2.12.6.	See Section 2.21.2.12.6.	
CleanupSockets	See Section 2.21.2.12.4.		

Table 2.21-133 CloseSocket Information.

2.21.2.10.5 YUMMCleanUp

YUMMCleanUp is used to bring down the system and its resources. It deletes and detaches the message queue, detaches semaphores and detaches shared memory. The function call is YUMMCleanUp(). Table 2.21-134 describes the internal variables used and functions called using this function.

Internal Variables			
Variable	Туре	Where Typedef Declared	
shmbuf	struct shmid_ds	/use/include/sys/shm.h	
shmid	int	Standard C type.	
CleanupSockets	extern void	See Section 2.21.2.12.4.	
	Calls		
Farmation			
Function	Where Described		
CleanupSockets	See Section 2.21.2.12.4.		
IPC_SystemError	See Section 2.21.2.5.1.		

Table 2.21-134 YUMMCleanUp Information.

2.21.2.10.6 SendMsg

SendMsg is used for one-way message passing. It sends a message via an AST according to the information found at dstSkt. dstSkt is the socket to deliver AST to now, msgKind is the kind of request (user-defined), msgLen is the length, in bytes, of msgData and msgData is a pointer to the message buffer. The function call is SendMsg(dstSkt, msgKind, msgLen, msgData). Table 2.21-135 describes the parameters used, errors returned and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
dstSkt	YUMMSocket	/simnet/rcs/libipc/yumm.h
msgKind	long	Standard C type.
msgLen	int	Standard C type.
msgData	pointer to char	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
messtype	messageType	/simnet/rcs/libipc/yummint.h
	Return Values	
Return Value	Type	Meaning
-1	int	Unsuccessful. Check error code returned in errno.
SendData(messtype, msgKing, msgLen, msgData)	int	Successful. Should return 0.
	Errors	
Error Name	Reason for Error	
IPC_BAD_SOCKET	Socket not opened by process.	

Calls		
Function	Where Described	
SendData	See Section 2.21.2.12.3.	

Table 2.21-135 SendMsg Information.

2.21.2.10.7 SendReq

SendReq is used for two-way message passing. It sends a request via an AST according to the information found at dstSkt. It expects a response to be sent to rspSkt. It assumes that dstSkt and rspSkt are valid. A bit of info indentifying the request may be passed in msgInfo if the user so desires. dstSkt is the socket to deliver AST to now, msgKind is the kind of request (user-defined), msgLen is the length, in bytes, of msgData and msgData is a pointer to the message buffer. The function call is SendReq(dstSkt, rspSkt, msgInfo, msgKind, msgLen, msgData). Table 2.21-136 describes the parameters used, errors returned and functions called using this function.

	Parameters		
Parameter	Туре	Where Typedef Declared	
dstSkt	YUMMSocket	/simnet/rcs/libipc/yumm.h	
rspSkt	YUMMSocket	/simnet/rcs/libipc/yumm.h	
msgInfo	long	Standard C type.	
msgKind	long	Standard C type.	
msgLen	int	Standard C type.	
msgData	pointer to char	Standard C type.	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
messtype	messageType	/simnet/rcs/libipc/yummint.h	
tid	short	Standard C type.	
	Return Values		
Return Value	Туре	Meaning	
-1	int	Unsuccessful. Check error code returned in errno.	
SendData(messtype, msgKing, msgLen, msgData)	int	Successful. Should return 0.	
	Errors		
Error Name	Reason for Error		
IPC_BAD_SOCKET	Socket not opened by process.		
IPC REQ FULL	Request table full.		
	Calls		
Function	Where Described		
GrabRegEntry	See Section 2.21.2.12.2.		
SendData	See Section 2.21.2.12.3.		
	OGE OCCION 2.21.2.12.0.		

Table 2.21-136 SendReq Information.

2.21.2.10.8 SendRsp

SendRsp is used for two-way mesage passing. It sends a response via an AST according to the information found through reqID. reqID is the number identifying the request this response is for, msgKind is the kind of request (user-defined), msgLen is the length, in bytes, of msgData and msgData is a pointer to the message buffer. The function call is SendRsp(). Table 2.21-137 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
reqID	messageType	/simnet/rcs/libipc/yummint.h
msgKind	long	Standard C type.
msgLen	int	Standard C type.
msgData	pointer to char	Standard C type.
Return Value	Return Values Type	Meaning
Return Value	Return Values Type	Meaning
SendData(reqID.s, msgKind, msgLen, msgData)	int	0 if successful1 if unsuccessful, error code returned in errno.
	Calls	
Function	Where Described	
SendData	See Section 2.21.2.12.3.	

Table 2.21-137 SendRsp Information.

2.21.2.10.9 Transact

Transact is used for two-way message passing. It sends out a request and does not return until a response is received or timeout has expired. It uses astpause() to accomplish this. dstSkt is the socket to deliver AST to now, msgKind is the kind of request (user-defined), msgLen is the length, in bytes, of msgData and msgData is a pointer to the message buffer. rcvKind returns the kind of response received. rcvLen is initialized to the max length of rcvData and returns the length of the received data. rcvData is a pointer to the data in the response. timeout is the time, in milliseconds, to wait for a response. The function call is Transact(dstSkt, msgKind, msgLen, msgData, rcvKind, rcvLen, rcvData, timeout). Table 2.21-138 describes the parameters used, errors returned and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
dstSkt	YUMMSocket	/simnet/rcs/libipc/yumm.h
msgKind	long	Standard C type.
msgLen	int	Standard C type.
msgData	pointer to char	Standard C type.
rcvKind	pointer to long	Standard C type.
rcvLen	pointer to int	Standard C type.
rcvData	pointer to char	Standard C type.
timeout	int	Standard C type.

	Internal Variabl	es
Variable	Туре	Where Typedef Declared
messType	messageType	/simnet/rcs/libipc/yummint.h
tid	short	Standard C type.
msg	messageBuf	/simnet/rcs/libipc/yummint.h
savepri	int	Standard C type.
	Return Values	s
Return Value	Туре	Meaning
0	int	Successful.
-1	int	Unsuccessful. Error code returned in errno.
	Errors	
Error Name	Reason for Error	
IPC_BAD_SOCKET	Socket not explicitly opened by process.	
IPC_REQ_FULL	Request table full.	
IPC_TIMED_OUT	Timeout exceeded before response arrived.	
IPC_NO_MESSAGE	No response found in message queue.	
IPC_WRITE_OVERRUN	More data in response than can be put in the rcvData buffer.	
	Calls	
Function	Where Described	
GrabReqEntry	See Section 2.21.2.12	.2.
SendData	See Section 2.21.2.12	.3.
IPC_SystemError	See Section 2.21.2.5.	1.

Table 2.21-138 Transact Information.

2.21.2.10.10 LkUpSocket

LkUpSocket looks for *name* in the socket table and returns the socket number, *sktnum*, associated with it. It does a linear search. If *name* is NULL, the function returns FALSE. The function call is LkUpSocket(name, sktnum). Table 2.21-139 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
name	pointer to char	Standard C type
sktnum	pointer to YUMMSocket	/simnet/rcs/libipc/yumm.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
i	short	Standard C type
	Return Values	
Return Value	Type	Meaning
FALSE	short	Name not found in table.
TRUE	short	Name found in table

Called By		
Function	Where Described	
OpenSocket	See Section 2.21.2.10.3.	

Table 2.21-139 LkUpSocket Information.

2.21.2.10.11 GetSocketName

GetSocketName returns the name associated with a given socket. Note that if the socket is closed, the name is meaningless. The function call is GetSocketName(sktnum, name). Table 2.21-140 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
sktnum	unsigned char	Standard C type.
name	pointer to char	Standard C type.
Return Value	Type	Meaning
	Return Values Type	Meaning
FALSE	short	Socket number is invalid, 'name' is meaningless.
TRUE	short	Socket number is valid, socket name is returned in 'name'

Table 2.21-140 GetSocketName Information.

2.21.2.10.12 ReportYUMMStatus

ReportYUMMStatus returns the status of the system and of each process registered in the statTable. The status consists of listing the various messge pasing counts, the ipc mechanisms involved with YUMM and information about the socket table. The function call is ReportYUMMStatus(). Table 2.21-141 describes the internal variables used by this function.

Internal Variables		
Variable	Type	Where Typedef Declared
oldpri	int	Standard C type.
i	int	Standard C type.

Table 2.21-141 ReportYUMMStatus Information.

2.21.2.11 yumminit.h

/simnet/rcs/libipc/yumminit.h

yumminit.h is the internal include file for the YUMM sources. Table 2.21-142 describes the variables used by yumminit.h.

Variables		
Variable	Туре	Where Typedef Declared
YUMMData	extern YUMMGlobals	/simnet/rcs/fibipc/yumminit.h

Table 2.21-142 yumminit.h Variable Information.

2.21.2.12 yummintern.c /simnet/rcs/libipc/yummintern.c

yummintern.c contains all the internal routines to Yet Unother Message-passing Mechanism (YUMM). Table 2.21-143 describes the variables used by yummintern.c

Variables		
Variable	Type	Where Typedef Declared
errno	extern int	Standard C type.
asthandler()	extern int	Standard C type.
YUMMData	YUMMGlobals	/simnet/rcs/libipc/yumminit.h

Table 2.21-143 yummintern.c Variable Information.

2.21.2.12.1 RcvMsg

RcvMsg is a generic AST handler. All ASTs come to RcvMsg first before the user's trace procedure and the user's AST handler are called. It grabs parameters off the message queue using param and passes them to the user's AST handler and trace program, if provided. *oldpc* is the old program counter and *oldpr* is the old priority. The function call is RcvMsg(param, oldpc, oldpri). Table 2.21-144 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
param	long	Standard C type.
oldpc	int	Standard C type.
oldpr	int	Standard C type.
	Internal Variabl	es
Variable	Туре	Where Typedef Declared
msgbuf	messageBuf	/simnet/rcs/libipc/yummint.h
msgTp	messageType	/simnet/rcs/libipc/yummint.h
msginfo	long	Standard C type.
msgLen	long	Standard C type.
sockEnt	sktEntry	/simnet/rcs/libipc/yummint.h
	Errors	
Error Name	Reason for Error	
IPC NO MESSAGE	Expected message was not found on the mesage queue.	
IPC_UNKNOWN_TYPE	An unknown type of messge was received.	
	Calls	
Function	Where Described	
IPC_SystemError	See Section 2.21.2.5.1	

Table 2.21-144 RcvMsg Information.

2.21.2.12.2 GrabRegEntry

GrabReqEntry enters information for this request into the next free entry in rqstTable. This table is used to hold user-defined information for asynchronous requests and to hold a flag which signifies if a response has come in yet for a synchronous requests. It returns the index of the new table entry if successful and -1 otherwise. The function call is GrabReqEntry(msgInfo, srcSkt). Table 2.21-145 describes the parameters used and errors returned using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
msglnfo	long	Standard C type.
srcSkt	YUMMSocket	/simnet/rcs/libipc/yumm.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
i	short	Standard C type.
oldpri	int	Standard C type.
	Return Values	
Return Value	Туре	Meaning
i	short	Index of new table entry.
-1	short	Unsuccessful.
	Errors	
Error Name	Reason for Error	
IPC_REQ_FULL	Request table is already full.	
F	Called By	
Function	Where Described	
Transact	See Section 2.21.2.10.9.	
SendReq	See Section 2.21.2.10.7.	

Table 2.21-145 GrabReqEntry Information.

2.21.2.12.3 SendData

SendData does the actual sending of data by putting parameters on the message queue and then sending an AST to the receiving process so it knows to read off of the message queue. It will not send to a closed socket. It truncates messages which are bigger than MAXMSGSIZE. msgType describes the message as either one-way, a synchronous or asynchronous request or an asynchronous respones. msgKind describes the kind of message, msgLen is the length of the data buffer and msgData is a pointer to an MCCMessageBuffer. The function call is SendData(msgType, msgKind, msgLen, msgData). Table 2.21-146 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
msgType	messageType	/simnet/rcs/libipc/yummint.h
msgKind	long	Standard C type.
msgLen	int	Standard C type.
msgData	pointer to char	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
msqBuf	messageBuf	/simnet/rcs/libipc/yummint.h
sockEnt	sktEntry	/simnet/rcs/libipc/yummint.h
SOCKLII	SKILIRIY	7 Sittille (7 CS/IIDIpC/ydfillillitt.ii
	Return Values	
Deturn Volus		I Manager I man
Return Value	Туре	Meaning
0	int	Successful.
-1	int	Unsuccessful
	Errors	
Error Name	Reason for Error	
IPC_TOO LONG	The message was too long.	
IPC PROCESS MISSING		
IPC CLOSED SOCKET	The process has disappeared. The socket is closed.	
IFC_CEOSED_SCCRET	The socker is closed.	
	Calls	
Function	Where Described

Transact	I See Section 2.21.2.10.9	
Transact SendRsp	See Section 2.21.2.10.9. See Section 2.21.2.10.8.	
Transact SendRsp SendReg	See Section 2.21.2.10.9. See Section 2.21.2.10.8. See Section 2.21.2.10.7.	

Table 2.21-146 SendData Information.

2.21.2.12.4 CleanupSockets

CleanupSockets is called from YUMMCleanup to close any outstanding sockets. The function call is CleanupSockets(). Table 2.21-147 describes the internal variables used and functions called using this function.

Internal Varia	ables
Туре	Where Typedef Declared
int	Standard C type.
lint	Standard C type.
Calls	
See Section 2.21.2	10.4
	Type int int Calls Where Described

Called By		
Function	Where Described	
/UMMCleanUp See Section 2.21.2.10.5.		

Table 2.21-147 CleanupSockets Information.

2.21.2.12.5 InitShMem

InitShMem initializes shared memory. This entails initializing all the YUMMHdlr entries in the socket table and initializing the process id used to get an internal process id for each process. The function call is InitShMem(). Table 2.21-148 describes the internal variables used by this function.

Internal Variables		
Variable	Type	Where Typedef Declared
i	short	Standard C type.
	Called By	
Function	Where Described	
YUMMInit	See Section 2.21.2.10.1.	

Table 2.21-148 InitShMem Information.

2.21.2.12.6 CleanupDeadSockets

CleanupDeadSockets goes through the socket table and closes those for which the corresponding process is no longer alive. The function call is CleanupDeadSockets(). Table 2.21-149 describes the internal variables used and functions called using this function.

•	Internal Variables	
Variable	Туре	Where Typedef Declared
i	int	Standard C type.
	Calls	
Function	Where Described

YUMMProcess	See Section 2.21.2.10.2.	

Table 2.21-149 CleanupDeadSockets Information.

2.21.2.12.7 GetInternProcID

GetInternProcID assigns a unique one byte number to procid. procid will be between 1 and NUMSYNCH-1, inclusive. It assigns procid by incrementing the byte counter in shared memory. The function call is GetInternProcID(). Table 2.21-150 describes the functions called using this function.

Calls		
Function	Where Described	
Lock	See Section 2.21.2.6.3.	
Unlock	See Section 2.21.2.6.4.	
	Called By	
Function Where Described		
YUMMProcess	See Section 2.21.2.10.2.	

Table 2.21-150 GetInternProcID Information.

2.21.2.12.8 SetUpSynchReq

SetUpSynchReq sets up a socket table entry to be used when a synchronous request is made. It sets up the entry indexed by the internal process id. The function call is SetUpSynchReq(procname). Table 2.21-151 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
procname	pointer to char	Standard C type.
	Called By	
Function	Where Described	
YUMMProcess	See Section 2.21.2.10.2.	

Table 2.21-151 SetUpSynchReq Information.

2.21.2.13 libipcerrs.c

/simnet/rcs/libipc/libipcerrs.c

libipcerrs.c is the error definition file generated by errcom.

2.21.2.13.1 IPC errinit

IPC_errinit is the error initialization routine for the IPC-Library facility. The function call is IPC_errinit(). Table 2.21-152 describes the function.

Called By		
Function	Where Described	
InitAlarms	See Section 2.21.2.4.1.	
AttachLocks	See Section 2.21.2.6.1.	
AttachSharedMem	See Section 2.21.2.7.1.	
AttachMsgQueue	See Section 2.21.2.8.1.	
YUMMInit	See Section 2.21.2.10.1.	
ipcerrinit	See Section 2.21.2.13.2.	

Table 2.21-152 IPC_errinit Information.

2.21.2.13.2 ipcerrinit

ipcerrinit is the Fortran entry point for the IPC-Library facility. The function call is ipcerrinit(). Table 2.21-153 describes the functions called using this function.

Calls		
Function Where Described		
IPC_errinit See Section 2.21.2.13.1.		

Table 2.21-153 ipcerrinit Information.

2.21.2.14 libipcerrs.err

/simnet/rcs/libipc/libipcerrs.err

libipcerrs.err defines the errors detected and reported by the IPC library.

Reference the Vehicles CSCI documentation Section 2.6.5.

2.21.7 libtdb

Terrain Database Access

libtdb is a set of utilities for accessing the generic application database used by the MCC, SAF and PVD. It provides a mechanism for localized terrain caching. Optionally, direct memory access can be used instead of caching (implemented in "memory.c")It also generates a number of useful data constructs based on the current terrain, such as the elevation at a given (x,y) coordinate, a hull/world cosine matrix for a given (x,y) coordinate and heading or a list of obstructions to ground traversal in a given area.

2.21.7.1 cache.h

/simnet/common/libsrc/libtdb/cache.h

cache.h contains definitions needed for the terrain caching system. Table 2.21-154 describes the variables used by cache.h.

Variables			
Variable Type Where Typedef D			
toc	extern TERRAIN_CACHE_CONTRO L	/simnet/common/libsrc/libtdb/ cache.h	
cache_map	extern pointer to CACHE_MAP	/simnet/common/libsrc/libtdb/ cache.h	

Tble 2.21-154 cache.h Variable Information.

2.21.7.2 map.h

/simnet/common/libsrc/libtdb/map.h

map.h defines types representing map coordinates and functions for manipulating these types.

2.21.7.3 objects.h

/simnet/common/libsrc/libtdb/objects.h

objects.h provides symbolic names for objects in the database.

2.21.7.4 tdb.h

/simnet/common/libsrc/libtdb/tdb.h

tdb.h contains definitions necessary for using the routines in libtdb. Table 2.21-155 describes the variables used by tdb.h.

Variables		
Variable	Type	Where Typedef Declared
tdb_info	extern TDB_INFO	/simnet/common/libsrc/libtdb/tdb.h
tdb_errno	extern INT_4	/simnet/common/include/glob al/mass_stdc.h

Table 2.21-155 tdb.h Variable Information.

2.21.7.5 tdb local.h

/simnet/common/libsrc/libtdb/tdb_local.h

tdb_local.h contains all the declarations which are external to the source files but internal to the module. Table 2.21-156 describes the variables used by tdb_local.h.

Variables		
Variable	Type	Where Typedef Declared
size_of_patch_guards	extern INT_4	/simnet/common/include/glob al/mass_stdc.h
patch_indices	extern pointer to INT_4	/simnet/common/include/glob al/mass_stdc.h
tdb_patch_guards	extern pointer to PATCH_GUARD	/simnet/common/libsrc/libtdb/t errain.h
guards_included	extern char	Standard C type.
tdb_status	extern TDB_STATUS	/simnet/common/libsrc/libtdb/t db.h
tdb_method_used	extern int	Standard C type.

Table 2.21-156 tdb_local.h Variable Information.

2.21.7.6 terrain.h

/simnet/common/libsrc/libtdb/terrain.h

terrain,h defines the terrain database format.

The database begins with a database header of type DB_HEADER. This structure is made up of two other structures, DB_INFORMATION and DB_MAP. The database information header field contains such information as the database name and version number, physical dimensions of terrain patches represented, miscellaneous features represented, and UTM to Cartesian coordinate offsets for the given database. The database map contains offsets from the beginning of the database to the patch indices, patch guards, and the first patch in the database.

The database header is followed by the patch indices. These indices are 4-byte integers. Each index is an offset from the beginning of the database to its corresponding patch. Patches are numbered from 0 to n-1, from left to right and from bottom to top. A macro, PATCH_INDEX(), defined in "tdb.h" takes a pointer to a TDB_POINT and returns the corresponding index. For n patches there are n+1 indices, so that the number of bytes for a patch can be determined by index[n+1] - index[n] for all cases.

The patch indices are followed by a list of patch guards with type PATCH_GUARD, one per patch. These patch guards contain minima/maxima information for the given patch, allowing intervisibility routines to determine if a patch needs to be examined more closely.

The listing of patch guards is followed by the listing of the actual patches. Each patch is prefaced by a header of type PATCH_HEADER. A patch header contains information about the number of vertices, edges, polygons, objects, trees, treelines, and tree canopies in the patch, as well as offsets from the beginning of the patch to each of these entities.

Following the patch header is the list of vertices, which are type TDB_POINT. The order in which the vertices appear is undefined.

The vertices are followed by the list of edges in the patch. Each edge has the type EDGE_DESCRIPTOR. The two vertices of the edge appear in the same order as they appear in the list of vertices, thereby eliminating the need to check both edge v1->v2 and edge v2->v1 when doing edge comparisons. Edges also have a grid locator word. The patch is divided into a 4 x 4 grid. The grid boxes are numbered from 1 to 16, starting from the lower-left corner and going left to right, then bottom to top. If an edge enters a given grid box, the appropriate bit is set.

The list of edges is followed by the list of polygons in the patch. A polygon is represented by a POLYGON_DESCRIPTOR. The polygon descriptor contains a grid locator word, indices into the vertex list for the polygon vertices, and a polygon info bit field. Consecutive pairs of vertices represent edges of the polygon. Rather than use bit fields, #defines and macros are provided for accessing the poly info bit fields.

A list of objects follows the list of polygons in the patch. An object is defined by an OBJECT_DESCRIPTOR. The object descriptor contains a grid locator word, the four vertices of the object, and an object info bit field. Again, #defines and macros are provided to access these bit fields.

The object list is followed by a list of trees of type TREE_DESCRIPTOR. The tree descriptor contains the type, centroid, radius and height of the tree.

The next group of data in the patch is the list of treelines. Each treeline is represented by a header of type TREELINE_HEADER followed by a list of vertices of type TDB_POINT. The treeline header contains the number of vertices in the treeline and the treeline's type, extents, height, and elevation. It also contains the number of bytes for the treeline, to make access of successive treelines easier.

The last group of data in the patch is a list of tree canopies. Each canopy is represented by a CANOPY_HEADER, followed by a list of the treelines in the canopy, a list of canopy polygon vertices, a list of canopy polygon edges, and finally a list of canopy polygons. The vertices/edges/polygons scheme is analogous to that used for terrain polygons. Currently, no direct support for tree canopies is available from the libtdb routines.

2.21.7.7 cache alloc.c

/simnet/common/libsrc/libtdb/cache alloc.c

cache_alloc.c contains routines for allocating memory for and terminating the terrain caching system. Table 2.21-157 describes the variables used by cache_alloc.c. patch_guards_obj and patch_indices_obj are variables that are only used when SIMBFLY is defined.

Variables		
Variable	Type	Where Typedef Declared
total_cache_memory_require d	INT_4	/simnet/common/include/glob al/mass_stdc.h
patch_guards_obj	extern OID	
patch_indices_obj	OID	

Table 2.21-157 cache_alloc.c Variable Information.

2.21.7.7.1 cache_init

cache_init initializes and allocates the memory for the terrain caching system. number_of_patches_in_cache is the number of terrain patches that will be cached. The function call is cache_init(number_of_patches_in_cache). Table 2.21-158 describes the parameters used, errors returned and functions called using this function with a MassComp computer. Table 2.21-159 describes the parameters used, errors returned and functions called using this function with a Butterfly.

Parameters			
Parameter	Type	Where Typedef Declared

2.21.7.7.2 cache_and_file_terminate

cache_and_file_terminate terminates the terrain caching system, freeing the index file space and closing the terrain binary or poly file. The function call is cache_and_file_terminate(). Table 2.21-160 describes the internal variables used, errors returned and functions called using this function with a MassComp computer. Table 2.21-161 describes the internal variables used, errors returned and functions called using this function with a Butterfly.

Table 2.21-161 Butterfly cache_and_file_terminate Information.

2.21.7.8 cache cntl.c

/simnet/common/libsrc/libtdb/cache_cntl.c

cache_cntl.c contains routines for enabling and disabling the terrain cache.

2.21.7.8.1 tdb_cache_enable

tdb_cache_enable enables the terrain cache. The routine resets the cache structure by calling init_terrain_cache() and init_cache_map(), and then sets the value of tdb_status.cache_enabled to TRUE to make the cache available. The function call is tdb_cache_enable(). Table 2.21-162 describes the functions called using this function.

Calls			
Function	Where Described		
init_terrain_cache	See Section 2.21.7.10.2.		
init_cache_map	See Section 2.21.7.10.3.		

Table 2.21-162 tdb_cache_enable Information.

2.21.7.8.2 tdb cache disable

tdb_cache_disable disables the terrain cache by setting the value of tdb_status.cache_enabled to FALSE. While the cache is disabled, the memory which it uses can be re-used to grab large "stripes" of consecutive patches using the function tdb_get_stripe(). When the user is finished with a stripe of patches, the cache must be re-enabled by making a call to tdb_cache_enable(). Note that all patches currently cached are removed when the cache is disabled. The function call is tdb_cache_disable(). Table 2.21-163 describes this function.

	Called By
Function	Where Described
tdb_init_memory	Se Section 2.21.7.25.1.

Table 2.21-163 tdb_cache_disable Information.

2.21.7.8.3 tdb p cache enabled

tdb_p_cache_enabled returns the value of tdb_status.cache_enabled. If the value is TRUE, the terrain cache is enabled; if the value is FALSE, the terrain cache is disabled. The function call is tdb_p_cache_enabled(). Table 2.21-164 describes the return values generated by this function.

	Return Va	lues
Return Value	Type	Meaning
TRUE	int	Cache is enabled.
FALSE	int	Cache is disabled.

Table 2.21-164 tdb_p_cache_enabled Information.

2.21.7.9 cache_data.c

/simnet/common/libsrc/libtdb/cache_data.c

cache_data.c contains storage allocation for globals in the terrain caching system. Table 2.21-165 describes the variables used by cache_data.c.

Variables			
Variable	Type	Where Typedef Declared	
patch_indices	pointer to INT_4	/simnet/common/include/glob al/mass_stdc.h	
tcc	TERRAIN_CACHE_CONTRO	/simnet/common/libsrc/libtdb/ cache.h	
cache_map	pointer to CACHE_MAP	/simnet/common/libsrc/libtdb/ cache.h	
size_of_patch_gurards	INT_4	/simnet/common/include/glob al/mass_stdc.h	
tdb_patch_guards	pointer to PATCH_GUARD	/simnet/common/libsrc/libtdb/t errain.h	
guards_included	char	Standard C type.	

Table 2.21-165 cache data.c Variable Information.

2.21.7.10 cache init.c

/simnet/common/libsrc/libtdb/cache_init.c

cache_init.c contains routines for initializing the terrain caching system. patch_guards_obj is only used if SIMBFLY is defined. Table 2.21-166 describes the variables used by cache_init.c.

Variables				
Variable	Туре	Where	Typedef	Declared
patch_guards_obj	OID			

Table 2.21-166 cache_init.c Variable Information.

2.21.7.10.1 init_patch_indices

init_patch_indices initializes the patch indices by reading in the index file. patch_indices points to the locked memory allocated to hold the entire index file. This index array contains pointers to each patch in the terrain file, with one index per patch. The function call is init_patch_indices(patch_indices). Table 2.21-167 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
patch_indices	register pointer to INT_4	/simnet/common/include/glob al/mass_stdc.h
	Internal Variables	
Variable	Type	Where Typedef Declared
bytes_to_read	register INT_4	/simnet/common/include/glob al/mass_stdc.h
	Return Values	
Return Value	Type	Meaning
-1	int	Unsuccessful.
0	int	Successful
	Errors	
Error Name	Reason for Error	
TE_OPEN_READ	Open or read on database fa	ailed.
	Called By	
Function	Where Described	
memory_init	See Section 2.21.7.25.2.	
cache_init	See Section 2.21.7.7.1.	

Table 2.21-167 init_patch_indices Information.

2.21.7.10.2 init_terrain_cache

init_terrain_cache initializes the local terrain cache. tccp is a pointer to the local terrain cache control. number_of_patches is the number of patches in the cache. The function call is init_terrain_cache(tccp, number_of_patches). Table 2.21-168 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
tccp	register pointer to TERRAIN_CACHE_CONTRO	/simnet/common/libsrc/libtdb/ cache.h
number_of_patches	iNT_4	/simnet/common/include/glob al/mass_stdc.h
	Internal Variables	
Variable	Type	Where Typedef Declared
i	register INT_4	/simnet/common/include/glob al/mass_stdc.h
start_data	register pointer to char	Standard C type.
	Called By	
Function	Where Described	
tdb_cache_enable	See Section 2.21.7.8.1.	
cache_init	See Section 2.21.7.7.1.	

Table 2.21-168 init terrain cache Information.

2.21.7.10.3 init_cache_map

init_cache_map initializes the cache map. cache_map maps the patch indices to cache indices. The function call is init_cache_map(cache_map). Table 2.21-169 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
cache_map	register pointer to CACHE_MAP	/simnet/common/libsrc/libtdb/ cache.h
	<u>Internal Variables</u>	<u> </u>
Variable	Type	Where Typedef Declared
i	register INT_4	/simnet/common/include/glob al/mass_stdc.h
	Called By	
Function	Where Described	
tdb_cache_enable	See Section 2.21.7.8.1	
cache init	See Section 2.21.7.7.1.	

Table 2.21-169 init_cache_map Information.

2.21.7.10.4 init patch guards

init_patch_guards initializes the patch guards. Patch guards are the minimum and maximum elevation limits of the patch, used in intervisibility calculations. The patch guards for the entire terrain data base can be read into locked memory. The function call is init_patch_guards(). Table 2.21-170 describes the internal variables used, errors returned and functions called using this function with a MassComp computer. Table 2.21-171 describes the internal variables used, errors returned and functions called using this function with a Butterfly.

Return Values			
Return Value	Туре	Meaning	
NULL	pointer to PATCH_GUARD	Unsuccessful	
tdb_patch_guards	pointer to PATCH_GUARD	Pointer to the successfully initialized patch guards.	
	Errors		
Error Name	Reason for Error		
TE_CACHE_MALLOC	malloc failed for terrain cache.		
TE_LOCK	Could not lock pages down in	memory.	
TE OPEN READ	Open or read on the database	e failed.	

Table 2.21-170 MassComp init patch guards Information.

Return Values				
Return Value	Туре	Meaning		
NULL	pointer to PATCH_GUARD	Unsuccessful		
tdb_patch_guards	pointer to PATCH_GUARD	Pointer to the successfully initialized patch guards		
	Errors			
Error Name	Reason for Error			
TE_CACHE_MALLOC	malloc failed for terrain cache.			
TE_OPEN_READ	Open or read on the database failed.			

Table 2.21-171 Butterfly init patch guards Information.

2.21.7.11 cache query.c

/simnet/common/libsrc/libtdb/cache_query.c

cache_query.c contains routines for retrieving local terrain and preprocessed terrain patches from the cache.

2.21.7.11.1 terrain_cache_inquire

terrain_cache_inquire retrieves a preprocessed terrain patch from cache. patch_index is the number of the patch of interest. The function returns a pointer to the start of the terrain patch if successful, a null pointer otherwise. The function call is terrain_cache_inquire(patch_index). Table 2.21-172 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
patch index	INT 4	/simnet/common/include/glob
· <u> </u>		al/mass_stdc.h
		_
	Internal Variable	98
Variable	Туре	Where Typedef Declared
cache_index	register INT_4	/simnet/common/include/glob al/mass_stdc.h
inquiry_size	INT_4	/simnet/common/include/glob al/mass_stdc.h
bytes_read	INT_4	/simnet/common/include/glob al/mass_stdc.h
i	INT_4	/simnet/common/include/glob al/mass_stdc.h
got_ont	char	Standard C type.
	Return Values	
Return Value	Type	Meaning
NULL	pointer to char	Unsuccessful
tcc.cache[cache_index].data	pointer to char	Pointer to the start of the terrain patch.
	Errors	
Error Name	Reason for Error	
TE_NO_SLOT	Can't find slot in the cac	he queue.
TE_PATCH_2BIG		er than MAX_LOCAL_PATCH_SIZE.
TE_OPEN_READ	Open or read on the data	abase failed.
	Calls	
Function	Where Described	
rotate_queue	See Section 2.21.7.12.	
dequeue_terrain_patch	See Section 2.21.7.12.	
enqueue_terrain_patch	See Section 2.21.7.12.	2.
	Called By	
Function	Where Described	
tdb_get_terrain	See Section 2.21.7.18.	1.

Table 2.21-172 terrain cache inquire Information.

2.21.7.11.2 tdb_get_stripe

tdb_get_stripe returns a pointer to a "stripe" of consecutive terrain patches from the patch indiciated by start up to and including the patch indicated by end. Individual patches can be extracted from the "stripe" using the information in the global array pointed to by patch_indices. It reuses the cache memory, so caching must be turned off before you cali it, and turned back on when you are done (tdb_disable_cache() and tdb_enable_cache()). If the patches cannot be retrieved, a null pointer is returned and the global terrain error variable tdb_errno is set. The function call is tdb_get_stripe(start, end). Table 2.21-173 describes the parameters used and errors returned using this function.

	Parameters		
Parameter	Туре	Where Typedef Declared	
start	register INT_4	/simnet/common/include/glob al/mass_stdc.h	
end	register INT_4	/simnet/common/include/glob al/mass_stdc.h	
	internal Variabi	es	
Variable	Туре	Where Typedef Declared	
inquiry_size	INT_4	/simnet/common/include/glob al/mass stdc.h	
bytes_read	INT_4	/simnet/common/include/glob al/mass_stdc.h	
	Return Values	3	
Return Value	Type	Meaning	
NULL	pointer to char	Unsuccessful.	
tcc.cache[0].data	pointer to char	Pointer to block of patches.	
	Errors		
Error Name	Reason for Error	······································	
TE STRIPE 2BIG		A terrain patch was larger than MAX_LOCAL_PATCH_SIZE.	
TE OPEN READ	Open or read on the database failed.		

Table 2.21-173 tdb_get_stripe Information.

2.21.7.12 cache_queue.c /simnet/common/libsrc/libtdb/cache_queue.c

cache_queue.c contains routines for queueing patches in the terrain cache. Table 2.21-174 describes the variables used by cache_queue.c.

Variables		
Variable	Туре	Where Typedef Declared
tcc	extern TERRAIN_CACHE_CONTRO L	/simnet/common/libsrc/libtdb/ cache.h

Table 2.21-174 cache_queue.c Variable Information.

2.21.7.12.1 dequeue_terrain_patch

dequeue_terrain_patch removes the patch specified by cache_index from the terrain queue. The function call is dequeue_terrain_patch(cache_index). Table 2.21-175 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
cache_index	register INT_4	/simnet/common/include/glob al/mass_stdc.h
	Called By	
Function	Where Described	
terrain_cache_inquire	See Section 2.21.7.11.1.	
rotate_queue	See Section 2.21.7.12.3.	

Table 2.21-175 dequeue_terrain_patch Information.

2.21.7.12.2 enqueue_terrain_patch

enqueue_terrain_patch places the patch specified by *cache_index* onto the end of the terrain queue. The function call is enqueue_terrain_patch(cache_index). Table 2.21-176 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
cache_index	register INT_4	/simnet/common/include/glob al/mass_stdc.h
	Called By	
Function	Where Described	
Function terrain_cache_inquire		

Table 2.21-176 enqueue terrain patch Information.

2.21.7.12.3 rotate_queue

rotate_queue is called by terrain_cache_inquire. The patch specified by *index* is first removed from the terrain queue, then placed on the end of the queue. The function call is rotate_queue(). Table 2.21-177 describes the internal variables used and functions called using this function.

Variable	Internal Var	Where Typedef Declared
index	INT_4	/simnet/common/include/glob al/mass_stdc.h
	Return Va	lues
Return Value	Return Va	lues Meaning

Calls		
Function	Where Described	
dequeue_terrain_patch	See Section 2.21.7.12.1.	
enqueue_terrain_patch	See Section 2.21.7.12.2.	
	Called By

terrain_cache_inquire	See Section 2.21.7.11.1.	

Table 2.21-177 rotate_queue Information.

2.21.7.13 consistent.c

/simnet/common/libsrc/libtdb/consistent.c

consistent.c contains a routine which checks terrain consistency.

2.21.7.13.1 tdb_consistent

tdb_consistent is used in debugging to check the terrain consistency. The function call is tdb_consistent(). Table 2.21-178 describes the internal variables used and functions called using this function.

	Internal Variables	
Variable	Type	Where Typedef Declared
İ	register INT_4	/simnet/common/include/glob al/mass_stdc.h
	register INT_4	/simnet/common/include/glob al/mass_stdc.h
coord	TDB_POINT	/simnet/common/libsrc/libtdb/t db.h
	Calls	
Function	Where Described	
tdb_get_z	See Section 2.21.7.16.2.	
tdb_error	See Section 2.21.7.17.1.	

Table 2.21-178 tdb_consistent Information.

2.21.7.14 data.c

/simnet/common/libsrc/libtdb/data.c

data.c contains all the storage allocation for globals in the tdb library. Table 2.21-179 describes the variables used by data.c.

Variables		
Variable	Туре	Where Typedef Declared
tdb_info	TDB_INFO	/simnet/common/libsrc/libtdb/t db.h
tdb_status	TDB_STATUS	/simnet/common/libsrc/libtdb/t db.h
tdb_errno	int	Standard C type.
tdb_err_string	array of 120 char	Standard C type.
patch_guards	pointr to PATCH_GUARD	/simnet/common/libsrc/libtdb/t errain.h
tdb_method_used	int	Standard C type.

Table 2.21-179 data.c Variable Information.

2.21.7.15 dump.c

/simnet/common/libsrc/libtdb/dump.c

dump.c contains routines for dumping out information about a terrain patch during debugging. Table 2.21-180 describes the variables used by dump.c.

Variables				
Variable	Туре	Where Typedef Declared		
terrain_object_names	pointer to array of MAX_NUM_OBJECT_TYPES char	Standard C type.		
terrain_texture_names	pointer to array of MAX_NUM_TEXTURE_TYPE S char	Standard C type.		
tdb_dumpfile	pointer to FILE	Standard C type.		

Table 2.21-180 dump.c Variable Information.

2.21.7.15.1 tdb_set_dumpfile

tdb_set_dumpfile allows you to specify an alternate output *file* for the tdb print and tdb dump routines. Otherwise, by default, output is sent to stderr. The function call is tdb_set_dumpfile(file). Table 2.21-181 describes the parameters used by this function.

Parameters				
Parameter	Туре	Where Typedef Declared		
file	pointer to FILE	Standard C type		
	Called By			
Function	Where Described			
tdb_init_memory	See Section 2.21.7.25.1.			
tdb_init_cache	See Section 2.21.7.27.1.			

Table 2.21-181 tdb_set_dumpfile Information.

2.21.7.15.2 tdb_get_dumpfile

tdb_get_dumpfile returns a pointer to tdb_dumpfile. The function call is tdb_get_dumpfile(). Table 2.21-182 describes the return values generated by this function.

Return Values				
Return Value	Туре	Meaning		
tdb_dumpfile	pointer to FILE	Pointer to tdb_dumpfile.		
	Called By			
Function	Where Described			
tdb_print_version	See Section 2.21.7.31.1.			
tdb_print_format_compatible	See Section 2.21.7.31.2.			
tdb_print_db_format	See Section 2.21.7.31.3.			

Table 2.21-182 tdb_get_dumpfile Information.

2.21.7.15.3 tdb_dump_terrain

tdb_dump_terrain prints all information in the patch specified by *coord*. The result is voluminous, and is intended for debugging. By default all output is sent to stderr. tdb_set_dumpfile allows you to specify an alternate output file. The function returns 0 if there is no problem accessing the requested patch. Otherwise, -1 is returned and the global terrain error variable *tdb_errno* is set. The function call is tdb_dump_terrain(coord). Table 2.21-183 describes the parameters used and functions called using this function.

Parameters				
Parameter	Туре	Where Typedef Declared		
coord	pointer to TDB_POINT	/simnet/common/libsrc/libtdb/t db.h		
	-			
	Internal Variables			
Variable	Type	Where Typedef Declared		
terrain	register pointer to char	Standard C type.		
	Return Values			
Return Value	Туре	Meaning		
-1	int	Unsuccessful.		
0	int	Successful.		
	Calls			
Function	Where Described			
tdb_get_terrain	See Section 2.21.7.18.1.			
dump terrain	See Section 2.21.7.15.4.			

Table 2.21-183 tdb_dump_terrain Information.

2.21.7.15.4 dump_terrain

dump_terrain gets information for a particular *patch*. The function call is dump_terrain(patch). Table 2.21-184 describes the parameters used and functions called using this function.

Parameters					
Parameter Type Where Typedef Declar					
patch	register pointer to char	Standard C type.			
Internal Variables					
Variable	Type	Where Typedef Declared			
i	register INT_4	/simnet/common/include/glo al/mass_stdc.h			
no_polygons	INT_4	/simnet/common/include/glob al/mass_stdc.h			
no_objects	INT_4	/simnet/common/include/glob al/mass_stdc.h			
no_trees	INT_4	/simnet/common/include/glob al/mass_stdc.h			
no_treelines	INT_4	/simnet/common/include/glob al/mass_stdc.h			
no_edges	INT_4	/simnet/common/include/glob al/mass_stdc.h			
no_canopies	INT_4	/simnet/common/include/glob al/mass_stdc.h			
no_canopy_vertices	INT_4	/simnet/common/include/glob al/mass_stdc.h			
no_canopy_edges	INT_4	/simnet/common/include/glob al/mass_stdc h			
vertices	register pointer to TERRAIN_POINT	/simnet/common/libsrc/libtdb/t errain.h			
patch_header	register pointer to PATCH_HEADER	/simnet/common/libsrc/libtdb/t errain.h			
polygons	pointer to POLYGON DESCRIPTOR	/simnet/common/libsrc/libtdb/t errain.h			
objects	pointer to OBJECT_DESCRIPTOR	/simnet/common/libsrc/libtdb/t errain.h			
treeline	pointer to TREELINE_HEADER	/simnet/common/libsrc/libtdb/t errain.h			
trees	pointer to TREE_DESCRIPTOR	/simnet/common/libsrc/libtdb/t errain.h			
edges	pointer to EDGE_DESCRIPTOR	/simnet/common/libsrc/libtdb/t errain.h			
canopies	pointer to CANOPY_HEADER	/simnet/common/libsrc/libtdb/t errain.h

canopy_edges	pointer to EDGE DESCRIPTOR	/simnet/common/libsrc/libtdb/t errain.h			

Calls		
Function	Where Described	
tdb_print_polygon	See Section 2.21.7.15.5.	
tdb_print_edge	See Section 2.21.7.15.6.	
tdb_print_object	See Section 2.21.7.15.7.	
tdb_print_trline	See Section 2.21.7.15.8.	
tdb_print_tree	See Section 2.21.7.15.10.	
tdb_print_canopy	See Section 2.21.7.15.14.	
	Called By	
Function	Where Described	
tdb_dump_terrain	See Section 2.21.7.15.3.	

Table 2.21-184 dump_terrain Information.

2.21.7.15.5 tdb_print_polygon

tdb_print_polygon prints information for a specified polygon. *poly* is a pointer to the polygon descriptor. *vertices* is a pointer to the terrain point. By default all output is sent to stderr. tdb_set_dumpfile allows you to specify an alternate output file. The function call is tdb_print_polygon(poly, vertices). Table 2.21-185 describes the parameters used and functions called using this function.

Parameters			
Parameter	Type	Where Typedef Declared	
poly	register pointer to POLYGON_DESCRIPTOR	/simnet/common/libsrc/libtdb/t errain.h	
vertices	register pointer to TERRAIN_POINT	/simnet/common/libsrc/libtdb/t errain.h	
	internal Variables		
Variable	Type	Where Typedef Declared	
İ	register INT_4	/simnet/common/include/glob al/mass_stdc.h	
no_vertices	register INT_4	/simnet/common/include/glob al/mass_stdc.h	
	0-11-

Table 2.21-187 tdb_print_object Information.

2.21.7.15.8 tdb_print_trline

tdb_print_trline prints information for a specified *treeline*. It assumes that the treeline header is followed in memory by the list of vertices for that treeline (as in the terrain cache). By default all output is sent to stderr. tdb_set_dumpfile allows you to specify an alternate output file. The function call is tdb_print_trline(treeline). Table 2.21-188 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
treeline	register pointer to TREELINE HEADER	/simnet/common/libsrc/libtdb/t errain.h	
	THE CONTRACT OF THE PROPERTY O	Torrain.	
	Internal Variables		
Variable	Туре	Where Typedef Declared

Function	Where Described		
tdb_print_canopy	See Section 2.21.7.15.14.		

Table 2.21-196 print_c_poly Information.

2.21.7.15.17 tdb_print_cache_status

tdb_print_cache_status prints current status information for the cache. Output includes whether the cache is initialized, whether the cache is enabled, cache size, cache hits, and cache faults. By default all output is sent to stderr. tdb_set_dumpfile allows you to specify an alternate output file. The function call is tdb_print_cache_status(). Table 2.21-197 describes the internal variables used by this function.

Internal Variables		
Variable	Type	Where Typedef Declared
cache_index	register INT_4	/simnet/common/include/glob al/mass_stdc.h

Table 2.21-197 tdb_print_cache status Information.

2.21.7.15.18 print_statistics

print_statistics prints statistical information. By default all output is sent to stderr. tdb_set_dumpfile allows you to specify an alternate output file. The function call is print_statistics(stats). Table 2.21-198 describes the parameters used by this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
stats	pointer to DB_STATS	/simnet/common/libsrc/libtdb/t errain.h	
	Called By		
Function	Where Described		
tdb_print_db_info	See Section 2.21.7.15.12.		

Table 2.21-198 print_statistics Information.

tdb_get_db_name returns the name of the terrain database being used. The function call is tdb_get_db_name(name). Table 2.21-199 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
name	register pointer to char Standard C type.	
	Return Values	
Return Value	Type	Meaning

Table 2.21-199 tdb_get_db_name Information.

2.21.7.15.20 tdb_get_db_version

tdb_get_db_version returns the version number of the terrain database being used. The function call is tdb_get_db_version(). Table 2.21-200 describes the return value generated by this function.

Return Values			
Return Value	Туре	Meaning	
tdb_info.db_header.db_info. version	INT_2	Database version.	

Table 2.21-200 tdb_get_db_version Information.

2.21.7.15.21 init_object_and_texture_names

init_object_and_texture_names initializes the list of terrain texture names and terrain object names. The function call is init_object_and_texture_names(). Table 2.21-201 describes the internal variables used by this function.

Internal Variables			
Variable	Туре	Where Typedef Declared	
i	register int	Standard C type.	
	Called By		
Function	Where Described		
tdb_init_memory	See Section 2.21.7.25.1.		
tdb_init_cache	See Section 2.21.7.27.1.		

Table 2.21-201 init_object_and_texture_names Information.

2.21.7.15.22 get_texture_name_list

get_texture_name_list returns the list of terrain texture names. The function call is get_texture_name_list(). Table 2.21-202 describes the return value generated by this function.

Return Values			
Return Value	Туре	Meaning	
terrain_texture_names	pointer to pointer to char	the list of terrain texture names	
	Oollo I D		
	Called By		
F	Where Described		
Function	Wilele Described		

Table 2.21-202 get texture name list Information.

2.21.7.15.23 get_object_name_list

get_object_name_list returns the list of terrain object names. The function call is get_object_name_list(). Table 2.21-203 describes the return value generated by this function.

Return Values			
Return Value	Type	Meaning	
terrain_object_names	pointer to pointer to char	the list of terrain object names	
	Called By		
Function	Where Described		

Table 2.21-203 get_object_name_list Information.

2.21.7.16 elevation.c

/simnet/common/libsrc/libtdb/elevation.c

elevation.c contains routines for getting an elevation from an (x,y) coordinate.

2.21.7.16.1 tdb_shade_get_z

tdb_shade_get_z fills in the z value with the elevation on the terrain at the (x,y) coordinates, returns the soil type of the supporting polygon, and sets the appropriate shade flag. The routine prioritizes polygons in order to search through to find which polygon includes the specified point. If the location is off the terrain database, the z value is set to 0.

check_objects allows the user to specify whether to check the elevation of objects in addition to terrain polygons. If check_objects is set to TDB_GROUND_ONLY, only terrain polygons are considered. If check_objects is TDB_CHECK_OBJECTS, then objects are considered along with the terrain. In the event that support is an object, SOIL_NA is returned.

The memory location pointed to by shade_flag is set to 0 if the support polygon is not shaded for a given sun angle, and 1 if it is. For TDB_SHADE_NO_SUN, the shade value is always 0.

tdb_shade_get_z returns the value -1 and sets the global terrain error variable tdb_errno if it can not determine the elevation at the given coordinates. If the location is off the terrain. tdb errno is set to TE_OFF_TERRAIN.

The function call is tdb_shade_get_z(coord, check_objects, sun_angle, shade_flag). Table 2.21-204 describes the parameters used, errors returned and functions called using this function.

	Parameters		
Parameter	Type	Where Typedef Declared	
coord	register pointer to	/simnet/common/libsrc/libtdb/t	
	TDB_POINT	db.h	
check_objects	int	Standard C type.	
sun_angle	int	Standard C type.	
shade_flag	pointer to int	Standard C type.	
	Internal Variables		
Variable	Type	Where Typedef Declared	
objects	register pointer to OBJECT_DESCRIPTOR	/simnet/common/libsrc/libtdb/t errain.h	
no_objects	INT_4	/simnet/common/include/glob al/mass_stdc.h	
İ	register INT_4	/simnet/common/include/glob al/mass_stdc.h	
support_poly	pointer to POLYGON_DESCRIPTOR	/simnet/common/libsrc/libtdb/t errain.h	
grid_map	pointer to GRID_MAP	/simnet/common/libsrc/libtdb/t errain.h	
vertices	pointer to TERRAIN_POINT	/simnet/common/libsrc/libtdb/t errain.h	
polys	pointer to POLYGON DESCRIPTOR	/simnet/common/libsrc/libtdb/t errain.h	
patch_header	pointer to PATCH_HEADER	/simnet/common/libsrc/libtdb/t errain.h	
support_found	int	Standard C type.	
patch	register pointer to char	Standard C type.	
prev_height	register REAL_8	/simnet/common/include/glob al/mass_stdc.h	
current_soil	char	Standard C type.	
	Return Values		
Return Value	Туре	Meaning	
-1	int	Unsuccessful.	
current_soil	int	Successful with no shade.	
GET_POLY_SOIL(support_p oly->poly_info)	int	Successful with shade.	
	Errors		
Error Name	Reason for Error		
TE_OFF_TERRAIN	Point given is off terrain databa		
TE_NO_SUPPORT	No support polygon could be found for an otherwise acceptable point.		

Calls		
Function	Where Described

Table 2.21-204 tdb_shade_get_z Information.

2.21.7.16.2 tdb_get_z

 tdb_get_z fills in the z value with the elevation on the terrain at the (x,y) coordinates, and returns the soil type of the supporting polygon. If the location is off the terrain database, the z value is set to 0.

check_objects allows the user to specify whether to check the elevation of objects in addition to terrain polygons. If check_objects is set to TDB_GROUND_ONLY, only terrain polygons are considered. If check_objects is TDB_CHECK_OBJECTS, then objects are considered along with the terrain. In the event that the support is an object, SOIL_NA is returned.

tdb_get_z returns the value -1 and sets the global terrain error variable tdb_errno if it can not determine the elevation at the given coordinates. If the location is off the terrain. tdb_errno is set to TE_OFF_TERRAIN.

The function call is tdb_get_z(coord, check_objects). Table 2.21-205 describes the parameters used and functions called using this function.

Parameters	
Type	Where Typedef Declared
register pointer to TDB_POINT	/simnet/common/libsrc/libtdb/t db.h
int	Standard C type
Internal Variable	S
Type	Where Typedef Declared
lint	Standard C type.
	register pointer to TDB_POINT int Internal Variable Type

Return Values		
Return Value	Туре	Meaning
tdb_shade_get_z(coord, check_objects, TDB_SHADE_NO_SUN, &dummy_shade)	int	Successful.
	Calls	
Function	Where Described

Table 2.21-205 tdb_get_z Information.

2.21.7.16.3 find_support

find_support determines if there is a support polygon at the given *coord* inate. The function call is find_support(support_poly, coord, grid_map, vertices, polys). Table 2.21-206 describes the parameters used and functions called using this function.

Parameters			
Parameter	Type	Where Typedef Declared	
support_poly	pointer to pointer to POLYGON DESCRIPTOR	/simnet/common/libsrc/libtdb/ errain.h	
coord	pointer to TDB_POINT	/simnet/common/libsrc/libtdb/tdb.h	
grid_map	register pointer to GRID_MAP	/simnet/common/libsrc/libtdb/t errain.h	
vertices	pointer to TERRAIN_POINT	/simnet/common/libsrc/libtdb/t	
polys	register pointer to POLYGON_DESCRIPTOR	/simnet/common/libsrc/libtdb/t errain.h	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
grid_number	register INT_2	/simnet/common/include/glob al/mass_stdc.h	
start_poly_index	register INT_4	/simnet/common/include/glob al/mass stdc.h	
end_poly_index	register INT_4	/simnet/common/include/glob al/mass_stdc.h	
i	register INT_4	/simnet/common/include/glob al/mass stdc.h	

Return Values		
Return Value	Туре	Meaning

get_grid_number	See Section 2.21.7.16.6.	
p_poly_provides_support	See Section 2.21.7.16.4.	

Table 2.21-206 find_support Information.

2.21.7.16.4 p_poly_provides_support

p_poly_provides_support determines whether the given *coord* inate is included in the specified polygon, *current_poly*. The function call is p_poly_provides_support(current_poly, coord, vertices). Table 2.21-207 describes the parameters used and functions called using this function.

	Parameters		
Parameter	Туре	Where Typedef Declared	
current_poly	register pointer to POLYGON_DESCRIPTOR	/simnet/common/libsrc/libtdb/t errain.h	
coord	register pointer to TDB_POINT	/simnet/common/libsrc/libtdb/ db.h	
vertices	register pointer to TERRAIN_POINT	/simnet/common/libsrc/libtdb/t errain.h

find support	See Section 2.21.7.16.3.	

Table 2.21-207 p_poly_provides_support Information.

2.21.7.16.5 find_height_on_poly

find_height_on_poly determines the elevation of the given (x,y) coordinate on the specified polygon, current_poly. The routine calculates the elevation (coord.z) based on the dot product of the vector v0->coord and a normal vector to the polygon equaling zero. If the normal vector is 0, -1 is returned, signifying an error. If the elevation is successfully calculated, 0 is returned. The function call is find_height_on_poly(current_poly, coord, vertices). Table 2.21-208 describes the parameters used, errors returned and functions called using this function.

	Parameters		
Parameter	Туре	Where Typedef Declared	
current_poly	pointer to POLYGON_DESCRIPTOR	/simnet/common/libsrc/libtdb/t errain.h	
coord	register pointer to TDB_POINT	/simnet/common/libsrc/libtdb/tdb.h

Table 2.21-209 get_grid_number Information.

2.21.7.17 error.c

/simnet/common/libsrc/libtdb/error.c

error.c contains routines for handling terrain error condition codes. Table 2.21-210 describes the variables used by error.c

Variables		
Variable	Туре	Where Typedef Declared
tdb_err_string	array of MAX_ERR_STRING char	Standard C type.

Table 2.21-210 error.c Variable Information.

2.21.7.17.1 tdb error

tdb_error returns a pointer to a short error message (no new-line) describing the last error encountered during a call to one of the terrain library routines. The error number is taken from the external variable *tdb_errno* which is set when errors occur but not cleared when non-erroneous calls are made. The function call is tdb_error(). Table 2.21-211 describes the internal variables used and functions called using this function.

	Internal Variables	
Variable	Туре	Where Typedef Declared
format	array of MAX_DB_FORMAT_LENGTH char	Standard C type.
	Return Values	
	_	
Return Value	Type	Meaning
tdb_err_string	pointer to char	the error message

Table 2.21-211 tdb_error Information.

2.21.7.17.2 tdb_p_on_database

tdb_p_on_database determines whether the given point p is on the database. The function call is tdb_p_on_database(p). Table 2.21-212 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
P	pointer to TDB_POINT	/simnet/common/libsrc/libtdb/tdb.h
	Return Values	
Return Value	Type	Meaning
FALSE	int	Point not on database.
TRUE	int	Point on database.

Table 2.21-212 tdb_p_on_database Information.

2.21.7.18 get_patch.c

/simnet/common/libsrc/libtdb/get_patch.c

get_patch.c contains a routine for retrieving terrain patches from the cache memory.

2.21.7.18.1 tdb_get_terrain

tdb_get_terrain returns a pointer to the patch which includes the (x,y) location point *coord*. If the patch cannot be retrieved, a null pointer is returned and the global terrain error variable *tdb_errno* is set. The function call is tdb_get_terrain(coord). Table 2.21-213 describes the parameters used, errors returned and functions called using this function.

"	Parameters	
Parameter	Туре	Where Typedef Declared
coord	pointer to TDB_POINT	/simnet/common/libsrc/libtdb/t db.h

Table 2.21-213 tdb_get_terrain Information.

2.21.7.19 gr_loc_num.c

/simnet/common/libsrc/libtdb/gr_loc_num.c

gr_loc_num.c contains a routine for getting a grid number from a patch.

2.21.7.19.1 tdb_get_grid_number

tdb_get_grid_number returns a grid number, given a *point* in patch coordinates and the *patch_size*. The number returned has a range from 0 to NUM_POLY_GRIDS-1, where NUM_POLY_GRIDS is NUM_GRIDS_PER_SIDE squared. The function call is tdb_get_grid_number(point, patch_size). Table 2.21-214 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared

current_soil	int	Standard C type.
global_shade	int	Standard C type.
global_sun_angle	int	Standard C type.

Table 2.21-215 h_to_w.c Variable Information.

2.21.7.20.1 tdb_get_hull_to_world

tdb_get_hull_to_world creates a hull-to-world matrix which will provide the proper transformation from hull coordinates to world coordinates for a vehicle on the terrain at the location *point* and with the given *heading* (in world coordinate radians). *hull_to_world* is the input pointer to the matrix which is filled out by this routine.

In case of failure, -1 is returned and the global terrain error variable tdb_errno is set, otherwise 0 is returned. If the failure is due to the given location being off the terrain $(tdb_errno == TE_OFF_TERRAIN)$, the hull-to-world matrix passed is set to a valid rotation matrix for level support with the given heading about the z-axis.

The function call is tdb_get_hull_to_world(point, heading, hull_to_world). Table 2.21-216 describes the parameters used, errors returned and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
point	pointer to TDB_POINT	/simnet/common/libsrc/libtdb/ldb.h
heading	REAL_8	/simnet/common/include/glob al/mass_stdc.h
hull_to_world	matrix of REAL_8	/simnet/common/include/glob al/mass_stdc.h

2.21.7.20.2 tracks set support plane

tracks_set_support_plane computes the unit normal of a support plane in world coordinates. h_to_w is the hull-to-world matrix for the vehicle, h_to_o is the hull-to-origin vector for the vehicle and u_norm receives the resultant unit normal. The function call is tracks_set_support_plane(h_to_w, h_to_o, u_norm). Table 2.21-217 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
h_to_w	register matrix of REAL_8	/simnet/common/include/glob al/mass_stdc.h

2.21.7.20.3 tracks calc unit normal

tracks_calc_unit_normal calculates the unit normal to a support plane defined by three points, p1, p2 and p3. result receives the unit normal. This unit normal is also passed to the kinematics code. The function call is tracks_calc_unit_normal(p1, p2, p3, result). Table 2.21-218 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
p1	register array of REAL_8	/simnet/common/include/glob al/mass_stdc.h

2.21.7.20.4 tdb_shade_place_vehicle

tdb_shade_place_vehicle creates a hull-to-world matrix which will provide the proper transformation from hull coordinates to world coordinates for a vehicle on the terrain at the location point and with the given heading. It determines the elevation at the support point, setting the z location accordingly, and returns the soil type of the supporting polygon. It also determines if the support polygon is in shade for the given sun_angle. The memory location pointed to by shade is set to 1 if the polygon is shaded, 0 otherwise. hull_to_world is the input pointer to the matrix which is filled out by this routine. In case of failure, -1 is returned and the global terrain error variable tdb_errno is set. The function call is tdb_shade_place_vehicle(point, heading, hull_to_world, sun_angle, shade). Table 2.21-219 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
point	register pointer to TDB_POINT	/simnet/common/libsrc/libtdb/tdb.h
heading	REAL_8	/simnet/common/include/glob al/mass_stdc.h

Table 2.21-223 object include Information.

2.21.7.23 lock.c

/simnet/common/libsrc/libtdb/lock.c

lock.c contains routines for locking and unlocking patches in the cache so they can't be swapped out. Note that they are removed if the cache is disabled.

2.21.7.23.1 tdb_lock_patch

tdb_lock_patch marks a terrain patch, specified by *coord*, as unpurgeable. Normally, a patch runs the risk of being purged any time a new patch is needed. It may therefore be necessary to lock in patches to which pointers are maintained. Locked patches can still be removed from the cache if the cache is disabled, leaving dangling pointers. If the patch requested is not in the cache, -1 is returned and the global terrain error variable *tdb_errno* is set. Otherwise 0 is returned. The function call is tdb_lock_patch(coord). Table 2.21-224 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
coord	pointer to TDB_POINT	/simnet/common/libsrc/libtdb/t db.h
	Internal Variables	
Variable	Type	Where Typedef Declared
patch_index	register INT_4	/simnet/common/include/glob al/mass_stdc.h
cache_index	register INT_4	/simnet/common/include/glob al/mass_stdc.h
	Return Values	
Return Value	Туре	Meaning
-1	int	Unsuccessful.
0	int	Successful.
Error Nome	Errors

PATCH_INDEX	Macro defined in /simnet/c	ommon/libsrc/libtdb/tdb.h.

Table 2.21-224 tdb_lock patch Information.

2.21.7.23.2 tdb_unlock_patch

tdb_unlock_patch marks a previously locked terrain patch, specified by *coord*, as purgeable. If the patch requested is not in the cache, -1 is returned and the global terrain error variable *tdb_errno* is set. Otherwise 0 is returned. The function call is tdb__nlock_patch(coord). Table 2.21-225 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
coord	pointer to TDB_POINT	/simnet/common/libsrc/libtdb/t db.h
	Internal Variables	
Variable	Туре	Where Typedef Declared

2.21.7.24 map.c

/simnet/common/libsrc/libtdb/map.c

map.c contains routines to convert between military and terrain coordinates. Table 2.21-226 describes the variables used by map.c.

	Variable	S
Variable	Type	Where Typedef Declared
scale[]	INT_4	/simnet/common/include/glob al/mass_stdc.h

Table 2.21-226 map.c Variable Information.

2.21.7.24.1 tdb_giv_utm_get_xy

tdb_giv_utm_get_xy converts the UTM coordinate string pointed to by utm_str to Cartesian coordinates, and places the results where coord indicates. A correctly formed UTM coordinate string consists of two alphabetic characters, the grid designator, followed by the x-direction digits, followed by the y-direction digits. The direction digits can contain 2, 3, 4, or 5 digits. The grid designator and direction digits are separated from each other by any number of non-digits. For example: ES-85-95; es * 85000 ** 95000. The routine checks the validity of the UTM coordinates, converting the numeric portion to meters from the lower-left corner of the grid zone. The letter pair is matched to the designation of a grid zone, and the UTM coordinate numbers are checked for inclusion within that grid zone. The function returns 0 upon successful completion. If an error occurs, -1 is returned and the global terrain error variable tdb_errno is set. The function call is tdb_giv_utm_get_xy(utm_str, coord). Table 2.21-227 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
utm_str	register pointer to char	Standard C type.
coord	pointer to TDB_POINT	/simnet/common/libsrc/libtdb/t db.h
	Return Values	
Return Value	Туре	Meaning
tdb_map_utm_to_xy(&(tdb_in fo.db_header.db_info.map_in fo), utm_str, coord)	int	the terrain coordinates in Cartesian coordinates
	Calls	
Function	Where Described	
tdb_map_utm_to_xy	See Section 2.21.7.24.2.	

Table 2.21-227 tdb giv utm get xy Information.

2.21.7.24.2 tdb map utm to xy

tdb_map_utm_to_xy converts from UTM to Cartesian coordinates, the same as tdb_giv_utm_get_xy. The map_info parameter allows conversion for any terrain database without initializing terrain caching. The function returns 0 upon successful completion. If an error occurs, -1 is returned and the global terrain error variable tdb_errno is set. The function call is tdb_map_utm_to_xy(map_info, utm_str, coord). Table 2.21-228 describes the parameters used and errors returned by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
map_info	register pointer to TerrainMap	/simnet/common/libsrc/libtdb/ map.h
utm_str	pointer to char	Standard C type.
coord	pointer to TDB_POINT	/simnet/common/libsrc/libtdb/t db.h

	Internal Variables	
Variable	Туре	Where Typedef Declared
	register INT_2	/simnet/common/include/glob al/mass_stdc.h
ch	register INT_2	/simnet/common/include/glob al/mass_stdc.h
zone	register pointer to GridZone	/simnet/common/libsrc/libtdb/ map.h
prec	INT_2	/simnet/common/include/glob al/mass_stdc.h
pt	LongPt	/simnet/mcc/include/longpt.h
str[maxMapCoordString]	char	Standard C type.
	Return Values	
Return Value	Туре	Meaning
-1	int	Unsuccessful.
0	int	Successful.
	Errors	
Error Name	Reason for Error	
TE_BADF_UTM	Invalid format for UTM string.

	Called By	
Function	Where Described	
tdb_giv_utm_get_xy	See Section 2.21.7.24.1.	

Table 2.21-228 tdb map utm to xy Information.

2.21.7.24.3 tdb_giv_xy_get_utm

tdb_giv_xy_get_utm converts the Cartesian coordinates given in *coord* into UTM coordinates, formats a string based on the *prec*ision and *separator* specified, and copies the result into *utm_str*. The *prec*ision indicates the number of digits in each direction; hence an 8-digit UTM coordinate string has a precision of 4. The *separator* is placed between the alphabetic grid designators and the x-direction digits, and again between the x-direction digits and the y-direction digits. A UTM coordinate string with a precision of 3 and a separator of - would have the format AA-000-000. If *separator* is the null character. no separator will be included in the string. The function returns 0 upon successful completion. If an error occurs, -1 is returned and the global terrain error variable *tdb_errno* is set. The function call is tdb_giv_xy_get_utm(coord, utm_str, prec, separator). Table 2.21-229 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
coord	register pointer to TDB_POINT	/simnet/common/libsrc/libtdb/tdb.h
utm_str	register pointer to char	Standard C type
prec	register INT_4	/simnet/common/include/glob al/mass_stdc.h
separator	char	Standard C type

	Return Values	
Return Value	Type	Meaning
tdb_map_xy_to_utm(&(tdb_in fo.db_header.db_info.map_in fo), coord, utm_str, prec, separator)	INT_4	If equal to 0, then operation was successful; if equal to -1, ann error is returned.

Table 2.21-229 tdb_giv_xy_get_utm Information.

2.21.7.24.4 tdb_map_xy_to_utm

tdb_map_xy_to_utm converts from Cartesian to UTM coordinates, the same as tdb_giv_xy_get_utm. The *map_info* parameter allows conversion for any terrain database without initializing terrain caching. The function returns 0 upon successful completion. If an error occurs, -1 is returned and the global terrain error variable *tdb_errno* is set. The function call is tdb_map_xy_to_utm(map_info, coord, utm_str, prec, separator). Table 2.21-230 describes the parameters used and errors returned by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
map_info	pointer to TerrainMap	/simnet/common/libsrc/libtdb/ map.h
coord	pointer to TDB_POINT	/simnet/common/libsrc/libtdb/tdb.h
utm_str	pointer to char	Standard C type.
prec	INT_4	/simnet/common/include/glob al/mass_stdc.h
separator	char	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
	register INT_2	/simnet/common/include/glob al/mass_stdc.h

2.21.7.26 objects.c

/simnet/common/libsrc/libtdb/objects.c

2.21.7.26.1 count objects_in_patch

count_objects_in_patch is called to determine how many objects are around the location bounded by the smaller of radius or the path boundary. The routine checks one terrain patch. If the area is not obstructed, 0 is returned. Otherwise, the number of obstructing objects is returned. The function call is count_objects_in_patch(objects, num_objects, location, radius). Table 2.21-235 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
objects	register pointer to OBJECT_DESCRIPTOR	/simnet/common/libsrc/libtdb/t errain.h
num_objects	INT_4	/simnet/common/include/glob al/mass_stdc.h

2.21.7.26.3 get_nth_object_in_patch

get_nth_object_in_patch is called to determine if the patch at the given location with the given radius contains the nth object, counting from start. If it does, nth_object will be a pointer to the OBJECT_DESCRIPTOR, and the function returns 0. Otherwise, nth_object will be null and the function returns start plus the number of objects in the patch. The function call is get_nth_object_in_patch(objects, num_objects, location, radius, start, n, nth_object). Table 2.21-237 describes the parameters used and functions called using this function.

	Parameters

2.21.7.26.4 tdb_nth_object

tdb_nth_object is called to retrieve the nth object in the area at the given *location* with the given *radius*. If *n* is greater than the number of objects in the area, a null pointer is returned and *tdb_errno* is set to TE_NO_OBJECT. If any other error occurs, the function returns -1 and *tdb_errno* is set accordingly. The function call is tdb_nth_object(location, radius, n, nth_object). Table 2.21-238 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared

Table 2.21-238 tdb_nth_object Information.

2.21.7.26.5 get closest_object_in_patch

get_closest_object_in_patch is called to fetch the closest object in the patch, within the given radius, to the given location. If found, the routine returns the distance to the object and objects is made to point to it. Otherwise, objects will be null and the function returns the original radius. The function call is get_closest_object_in_patch(objects, num_objects, location, radius, close_one, found_one). Table 2.21-239 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
objects	register pointer to OBJECT_DESCRIPTOR	/simnet/common/libsrc/libtdb/t errain.h
num_objects	INT_4	/simnet/common/include/glob al/mass stdc.h

2.21.7.26.7 get_obstr_object_in_patch

get_obstr_object_in_patch is called to fetch the closest object in the patch, with a height of at least min_height, which after expansion is on the line from start to end. If found, the routine returns 1 and result is made to point to it. Otherwise, result will be null and the function returns 0. The function call is get_obstr_object_in_patch(objects, num_objects, start, end, min_height, expansion, result, distance_squared). Table 2.21-241 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
objects	register pointer to OBJECT_DESCRIPTOR	/simnet/common/libsrc/libtdb/t errain.h

2.21.7.26.8 tdb obstr object

tdb_obstr_object is called to retrieve the closest object on the line from start to end after expansion with a height of at least min_height. If no such object is found, object is set to the null pointer, -1 is returned and tdb_errno is set to TE_NO_OBJECT. Otherwise, the object pointed to by object is set to the object found and 0 is returned. If an error occurs, the function returns -1 and tdb_errno is set accordingly. The function call is tdb_obstr_object(start, end, min_height, expansion, object). Table 2.21-242 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared

2.21.7.26.9 rectangle_intersected

rectangle_intersected checks to see if a line crosses through a rectangle using a Cohen-Sutherland clipper. It returns 1 if intersection occurs, 0 otherwise. The distance_squared variable is filled in with the square of the distance from the left-center of the box to the closest intersecting point if the check_distance flag is set (this is useful for finding the "closest" clipped line segment). The function call is rectangle_intersected(start, end, lower_left, upper_right, check_distance, distance_squared). Table 2.21-243 describes the parameters used by this function.

Parameters		
Parameter	Type	Where Typedef Declared
start	register pointer to TDB_POINT	/simnet/common/libsrc/libtdb/t db.h
end	register pointer to TDB_POINT	/simnet/common/libsrc/libtdb/t db.h

Table 2.21-243 rectangle intersected Information.

2.21.7.26.10 object_intersected

object_intersected checks to see if a line, expanded into a rectangle by expansion, crosses through an object. The rectangle is rotated so that it is parallel to the x-axis and then a modified Sutherland-Cohen is applied. This modified version finds the distance_squared from the original start point to the point of intersection. The distance to the closest such point is returned. The routine returns 1 if intersection occurs, 0 otherwise. The function call is object_intersected(start, end, object, expansion, distance_squared). Table 2.21-244 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared

2.21.7.27 tdb init.c

/simnet/common/libsrc/libtdb/tdb_init.c

tdb_init.c contains routines for initializing and terminating the tdb terrain caching system.

2.21.7.27.1 tdb_init_cache

tdb_init_cache initializes the terrain caching system. It opens the database file specified, reads the database indices and header, initializes the tdb_info structure, and allocates and locks in enough space to cache up to the number of patches given. The function returns -1 and the global terrain error variable tdb_errno is appropriately set if initialization fails for any reason. Otherwise, 0 is returned. The function call is tdb_init_cache(pathname, number_of_patches_in_cache). Table 2.21-245 describes the parameters used, errors returned and functions called using this function

Parameters			
Parameter	Туре	Where Typedef Declared	
pathname	register pointer to char	Standard C type.	
number_of_patches_in_cach e	INT_4	/simnet/common/include/glob al/mass_stdc.h	
	Return Values		
Return Value	Туре	Meaning	
-1	int	Unsuccessful.	
0	int	Successful.	
	Errors		
Error Name	Reason for Error		
TE_BAD_FORMAT	Database has wrong format for this version of libtdb.

2.21.7.28 things.c

/simnet/common/libsrc/libtdb/things.c

things.c contains routines for retrieving a copy of the closest thing (object, tree, or treeline) in a patch.

2.21.7.28.1 tdb_close_thing

tdb_close_thing determines if the patch at the given location within the given radius contains an object, tree, or treeline. If it does, thing will become a pointer to the closest thing found and the function returns the distance to it. Flags specifies which of the three types of things is to be considered, either singly or combined. The function returns -1 if an error occurs or if nothing is located. If an error occurs, the global terrain error variable

tdb_errno is set. The function call is tdb_close_thing(coord, radius, thing, flags). Table 2.21-248 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
coord	pointer to TDB_POINT	/simnet/common/libsrc/libtdb/t db.h
radius	REAL_8	/simnet/common/include/glob al/mass_stdc.h
thing	pointer to TDB_THING	/simnet/common/libsrc/libtdb/t db.h

2.21.7.29 treelines.c /simnet/libsrc/libtdb/treelines.c

2.21.7.29.1 count treelines in patch

count_treelines_in_patch is called to determine if the area at the given *location* with the given *radius* is obstructed by any *treelines* in the given patch. If the area is not obstructed. 0 is returned. Otherwise, the number of obstructing treelines is returned. The function call is count_treelines_in_patch(treelines, num_treelines, location, radius). Table 2.21-250 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
treelines	register pointer to TREELINE_HEADER	/simnet/common/libsrc/libtdb/t errain.h
num_treelines	INT_4	/simnet/common/include/glob al/mass_stdc.h

Table 2.21-250 count_treelines_in_patch Information.

2.21.7.29.2 tdb_trline_count

tdb_trline_count is called to determine if the area at the given *location* with the given *radius* is obstructed by any treelines. If the area is not obstructed, 0 is returned. Otherwise, the number of obstructing treelines is returned. If an error occurs, -1 is returned and the global terrain error variable *tdb_errno* is set. The function call is tdb_trline_count(location, radius). Table 2.21-251 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared

2.21.7.29.3 get_nth_treeline_in_patch

get_nth_treeline_in_patch is called to determine if the patch at the given *location* with the given *radius* contains the *nt*h treeline, counting from *start*. If it does, *nth_treeline* will be a pointer to the TREELINE_HEADER and the function returns 0. Otherwise, *nth_treeline* will be null and the function returns start plus the number of treelines in the patch. The function call is get_nth_treeline_in_patch(treelines, num_treelines, location, radius, atart, n, nth_treeline). Table 2.21-252 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
treelines	register pointer to TREELINE_HEADER	/simnet/common/libsrc/libtdb/t errain.h
num_treelines	register INT_4	/simnet/common/include/glob al/mass_stdc.h
location	register pointer to TDB_POINT	/simnet/common/libsrc/libtdb/t db.h

Table 2.21-252 get_nth_treeline_in_patch Information.

2.21.7.29.4 tdb_nth_trline

tdb_nth_trline is called to retrieve the *n*th treeline in the area at the given *location* with the given *radius*. If *n* is greater than the number of treelines in the area, a null pointer is returned and *tdb_errno* is set to TE_NO_TREELINE. If any other error occurs, the function returns -1 and *tdb_errno* is set accordingly. The function call is tdb_nth_trline(location, radius, n, nth_treeline). Table 2.21-253 describes the parameters used, errors returned and functions called using this function.

2.21.7.29.5 get_closest_treeline_in_patch

get_closest_treeline_in_patch is called to fetch the closest treeline in the patch, within the given radius, to the given location. If found, the routine returns the distance to the treeline and treelines is made to point to it. Otherwise, treelines will be null and the function returns the original radius. The function call is get_closest_treeline_in_patch(treelines, num_treelines, location, radius, close_one, found_one). Table 2.21-254 describes the parameters used by this function.

Parameters			
Parameter	Type	Where Typedef Declared	
treelines	register pointer to TREELINE HEADER	/simnet/common/libsrc/libtdb/t errain.h	
num_treelines	INT_4	/simnet/common/include/glob al/mass_stdc.h	
location	register pointer to	/simnet/common/libsrc/libtdb/t db.h	
radius	REAL_8	/simnet/common/include/glob al/mass_stdc.h	
close_one	pointer to TREELINE_HEADER	/simnet/common/libsrc/libtdb/t errain.h	
found_one	pointer to char	Standard C type.	
	internal Variables

Table 2.21-254 get_closest_treeline_in_patch Information.

2.21.7.29.6 tdb_close_trline

tdb_close_trline is called to retrieve the closest treeline in the area at the given *location* with the given *radius*. If there are no treelines in the area, *closest_one* is set to the null pointer, -1 is returned and *tdb_errno* is set to TE_NO_TREELINE. Otherwise, *closest_one* is set to point to the treeline and the distance to the treeline is returned. If any other error occurs, the function returns -1 and *tdb_errno* is set accordingly. The function call is tdb_close_trline(location, radius, closest_one). Table 2.21-255 describes the parameters used, errors returned and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
location	register pointer to TDB_POINT	/simnet/common/libsrc/libtdb/tdb.h	
radius	REAL_8	/simnet/common/include/glob al/mass_stdc.h

2.21.7.30 trees.c

/simnet/common/libsrc/libtdb/trees.c

2.21.7.30.1 count_trees_in_patch

count_trees_in_patch is called to determine if the area at the given *location* with the given *radius* is obstructed by any *trees* in the given patch. If the area is not obstructed 0 is returned. Otherwise, the number of obstructing trees is returned. The function call is count_trees_in_patch(trees, num_trees, location, radius). Table 2.21-256 describes the parameters used by this function.

Parameters				
Parameter	Туре	Where Typedef Declared		
trees	register pointer to	/simnet/common/libsrc/libtdb/t		
	TREE_DESCRIPTOR	errain.h		
num_trees	INT_4	/simnet/common/include/glob

Function	Where Described			
tdb_tree_count	See Section 2.21.7.30.2.			

Table 2.21-256 count_trees_in_patch Information.

2.21.7.30.2 tdb_tree_count

tdb_tree_count is called to determine if the area at the given *location* with the given *radius* is obstructed by any trees. If the area is not obstructed 0 is returned. Otherwise, the number of obstructing trees is returned. If an error occurs, the function returns -1 and sets the global terrain error variable. The function call is tdb_tree_count(location, radius). Table 2.21-257 describes the parameters used and functions called using this function.

Parameters				
Parameter Type Where Typedef Declared				
location	register pointer to TDB_POINT	/simnet/common/libsrc/libtdb/t db.h		
radius	REAL_8	/simnet/common/include/glob al/mass stdc.h		
	internal Variables			
Variable	Туре	Where Typedef Declared		
patch	register pointer to char	Standard C type.

Table 2.21-257 tdb_tree_count Information.

2.21.7.30.3 get_nth_tree_in_patch

get_nth_tree_in_patch is called to determine if the patch at the given *location* with the given *radius* contains the *n*th tree, counting from *start*. If it does, *nth_tree* will be a pointer to the TREE_DESCRIPTOR and the function returns 0. Otherwise, *nth_tree* wil be null and the function returns start plus the number of trees in the patch. The function call is get_nth_tree_in_patch(trees, num_trees, location, radius, start, n, nth_tree). Table 2.21-258 describes the parameters used by using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
trees	register pointer to TREE_DESCRIPTOR	/simnet/common/libsrc/libtdb/t errain.h
num_trees	register INT_4	/simnet/common/include/glob al/mass_stdc.h
location	register pointer to TDB_POINT	/simnet/common/libsrc/libtdb/t db.h
radius	REAL_8	/simnet/common/include/glob al/mass_stdc.h
start	register INT_4	/simnet/common/include/glob al/mass_stdc.h
n	register INT_4	/simnet/common/include/glob al/mass_stdc.h
nth_tree	pointer to TREE_DESCRIPTOR	/simnet/common/libsrc/libtdb/t errain.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
i	register INT_4	/simnet/common/include/glob al/mass_stdc.h
	Return Values	
Return Value	Туре	Meaning
start	int	Number of trees in patch or the nth tree.
	Called By	
Function	Where Described	
tdb_nth_tree	See Section 2.21.7.30.4.	

Table 2.21-258 get nth tree in patch Information.

2.21.7.30.4 tdb_nth_tree

tdb_nth_tree is called to retrieve the *n*th tree in the area at the given *location* with the given *radius*. If *n* is greater than the number of trees in the area, a null pointer is returned and *tdb_errno* is set to TE_NO_TREE. If any other error occurs, the function returns -1 and *tdb_errno* is set accordingly. The function call is tdb_nth_tree(location, radius, n, nth_tree). Table 2.21-259 describes the parameters used, errors returned and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared

2.21.7.31 version.c

/simnet/common/libsrc/libtdb/version.c

version.c contains routines for accessing the version numbers of libtdb and any database it accesses (with format >= v3.01).

2.21.7.31.1 tdb_print_version

tdb_print_version prints the terrain database version number. The function call is tdb_print_version(). Table 2.21-262 describes the functions called using this function.

Calls		
Function	Where Described	
tdb_get_dumpfile	See Section 2.21.7.15.2.	

Table 2.21-262 tdb print_version Information.

2.21.7.31.2 tdb_print_format_compatible

tdb_print_format_compatible prints the database format version number with which this version of libtdb works. The function call is tdb_print_format_compatible(). Table 2.21-263 describes the functions called using this function.

Calls		
Function	Where Described	
tdb_get_dumpfile	See Section 2.21.7.15.2.	

Table 2.21-263 tdb_print_format_compatible Information.

2.21.7.31.3 tdb_print_db_format

tdb_print_db_format prints the database format name. The function call is tdb_print_db_format(). Table 2.21-264 describes the internal variables used and functions called using this function.

	Internal Variables	
Variable	Туре	Where Typedef Declared
format	array of MAX_DB_FORMAT_LENGTH char	Standard C type.
	Calls	
Function	Where Described	
tdb_get_dumpfile	See Section 2.21.7.15.2.	
tdb_get_db_format	See Section 2.21.7.31.5.

2.22 The Macintosh Libraries and Headers

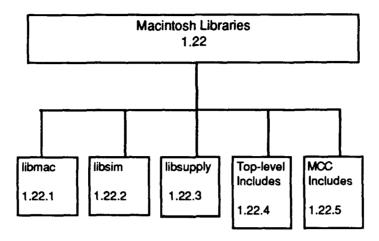

Figure 2.21-1: Macintosh Libraries.

2.22.1 libmac

Folder: "Development:SIMNET:libmac"

This folder contains a library of C functions shared among all MCC Macintosh applications. The library is composed of the following C source code files:

2.22.1.1 libmac.h

Development:SIMNET:libmac:libmac.h

librac.h defines the interface to many of the functions in the librac library. Table 2.22-1 describes the variables used by librac.h.

Variables		
Variable	Type	Where Typedef Declared
atpSocket	extern int	Standard C type.
hostNode	extern int	Standard C type.
hostSocket	extern int	Standard C type.
application	extern pointer to char	Standard C type
authors	extern pointer to char	Standard C type.
copyright	extern pointer to char	Standard C type.

Table 2.22-1 libmac.h Variable Information.

2.22.1.2 draw.h

Development:SIMNET:libmac:draw.h

draw.h defines constants that control the proportions of displayed information.

2.22.1.3 atalk.c

Development:SIMNET:libmac:atalk.c

atalk.c contains routines supporting AppleTalk communication with the MCC host. Table 2.22-2 describes the variables used by atalk.c.

Variables		
Variable	Туре	Where Typedef Declared
atpSocket	short	Standard C type.
hostNode	int	Standard C type.
hostSocket	int	Standard C type.
ab	ABRecHandle	Development:THINK C: Mac #includes:Appletalk.h

Table 2.22-2 atalk.c Variable Information.

2.22.1.3.1 SetUpAppleTalk

SetUpAppleTalk initializes the Appletalk communications with the MCC host. The routine returns a handle to the network event that starts up the console. *maxRequestSize* is the maximum number of bytes the request will be. The function call is SetUpAppleTalk(maxRequestSize). Table 2.22-3 describes the parameters used and functions called using this function.

	Parameters	_
Parameter	Туре	Where Typedef Declared
maxRequestSize	int	Standard C type.
	internal Variabi	es
Variable	Туре	Where Typedef Declared
addrRcvd	AddrBlock	Development:THINK C:
		Mac #includes:Appletalk.h
<u>i</u>	int	Standard C type.
errCode	int	Standard C type.
ab	ABRecHandle	Development:THINK C:
		Mac #includes:Appletalk.h
entity	EntityName	Development:THINK C:
		Mac #includes:Appletalk.h
hdl	StringHandle	Development:THINK C:
		Mac #includes:MacTypes.h
dp	DialogPtr	Development:THINK C:
		Mac #includes:DialogMgr.h
whichDialog	DialogPtr	Development:THINK C:
		Mac #includes:DialogMgr.h
myEvent	EventRecord	Development:THINK C:
		Mac #includes:EventMgr.h
	Return Values	S
Return Value	Туре	Meaning
myEvent.message	Handle	handle to the network event
•		that starts up the console

Calls		
Function	Where Described	
ATPLoad	Standard Appletalk Manager function for Macintosh.	
NBPLoad	Standard Appletalk Manager function for Macintosh.	
BigProb	See Section 2.22.1.8.2.	
ATPOpenSocket	Standard Appletalk Manager function for Macintosh.	
SystemFailure	See Section 2.22.1.8.1.	
NewHandle	Standard Memory Manager function for Macintosh.	
HLock	Standard Memory Manager function for Macintosh.	
NewPtr	Standard Memory Manager function for Macintosh.	
HUnlock	Standard Memory Manager function for Macintosh.	
ATPGetRequest	Standard Appletalk Manager function for Macintosh.	
ATPCloseSocket	Standard Appletalk Manager function for Macintosh.	
GetString	Standard Toolbox Utility function for Macintosh.	
BlockMove	Standard Memory Manager function for Macintosh.	
DisposHandle	Standard Memory Manager function for Macintosh.	
NBPRegister	Standard Appletalk Manager function for Macintosh.	
GetNewDialog	Standard Dialog Manager function for Macintosh.	
LastCaution	See Section 2.22.1.4.3.	
SystemTask	Standard Desk Manager function for Macintosh.	
GetNextEvent	Standard Toolbox Event Manager function for Macintosh.	
ExitToShell	Standard Segment Loader function for Macintosh.	
IsDialogEvent	Standard Dialog Manager function for Macintosh.	
DialogSelect	Standard Dialog Manager function for Macintosh.	
DisposDialog	Standard Dialog Manager function for Macintosh.	

Table 2.22-3 SetUpAppleTalk Information.

2.22.1.3.2 SetUpATPRequest

SetUpATPRequest sets up the fields of the ATPRequest record. ab is the handle to the Appletalk structure; userData is reserved for whatever the user wants; req is the pointer to request data; reqSize is the size of the request data; rsp is the pointer to where response should go; rspSize is the maximum size of rsp; xo indicates whether the transaction should be exactly once or at least once. The function call is SetUpATPRequest(ab, userData, req, reqSize, rsp, rspSize, xo). Table 2.22-4 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
ab	register ABRecHandle	Development:THINK C: Mac #includes:Appletalk.h
userData	long	Standard C type.
req	Ptr	Development:THINK C: Mac #includes:MacTypes.h
reqSize	int	Standard C type.
rsp	Ptr	Development:THINK C: Mac #includes:MacTypes.h
rspSize	int	Standard C type.
XO	int	Standard C type.

Called By		
Function	Where Described	
ATPPut	See Section 2.22.1.3.3.	
DownloadTerrainMap	See Section 2.22.1.3.4.	

Table 2.22-4 SetUpATPRequest Information.

2.22.1.3.3 ATPPut

ATPPut sends an ATP request and gets a response. The function call is ATPPut(code, req, reqSize, rsp, RspSize, xo). Table 2.22-5 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
code	long	Standard C type.
req	Ptr	Development:THINK C: Mac #includes:MacTypes.h
reqSize	int	Standard C type.
rsp	Ptr	Development:THINK C: Mac #includes:MacTypes.h
rspSize	int	Standard C type.
xo	int	Standard C type.
	-	
	Internal Variables	
Variable	Type	Where Typedef Declared
errCode	int	Standard C type.
	Dodge Wales	
	Return Values	
Return Value	Type	Meaning
-1	int	Unsuccessful
(ab)->atpProto.atpActCount	int	Actual size of the response.
•	Calls	
Function	Where Described	
NewHandle	Standard Memory Manager function for Macintosh.	
SetUpATPRequest	See Section 2.22.1.3.2.	
ATPRequest	Standard Appletalk Manager function for Macintosh.	
ATPError	See Section 2.22.1.3.6.	

Table 2.22-5 ATPPut Information.

2.22.1.3.4 DownloadTerrainMap

DownloadTerrainMap obtains the TerrainMap description of the terrain mapping from the host. The function call is DownloadTerrainMap(userData). Table 2.22-6 describes the parameters used and functions called using this function.

Parameter	Type	Where Typedef Declared
userData	long	Standard C type.

-	Internal Variables	
Variable	Туре	Where Typedef Declared
ab	register ABRecHandle	Development:THINK C: Mac #includes:Appletalk.h
n	char	Standard C type.
errCode	int	Standard C type.
Function	Where Described	
	Calls	
NewHandle	Standard Memory Manager function for Macintosh.	
SetUpATPRequest	See Section 2.22.1.3.2.	
ATPRequest	Standard Appletalk Manager function for Macintosh.	
ATPError	See Section 2.22.1.3.6.	
DisposHandle	Standard Memory Manager function for Macintosh.	

Table 2.22-6 DownloadTerrainMap Information.

2.22.1.3.5 NetworkEventHandler

NetworkEventHandler fields a network event signifying completion of an asynchronous AppleTalk transaction. *theEvent* holds information about the network event; *requestHandler* is the pointer to the function to call if network event is a request; *responseHandler* is a pointer to the function to call if this is a response. The function call is NetworkEventHandler(theEvent, requestHandler, responseHandler). Table 2.22-7 describes the parameters used and functions called using this function.

Parameters			
Parameter	Type	Where Typedef Declared	
theEvent	pointer to EventRecord	Development:THINK C: Mac #includes:EventMgr.h	
(requestHandler)()	pointer to void function	Standard C type.	
(responseHandler)()	pointer to void function	Standard C type.	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
ab	register ABRecHandle	Development:THINK C: Mac #includes:Appletalk.h	
errCode	int	Standard C type.	
	Calls		
Function	Where Described	Where Described	
ATPError	See Cection 2.22.1.3.6.	See Cection 2.22.1.3.6.	
DisposPtr	Standard Memory Manager	Standard Memory Manager function for Macintosh.	
DisposHandle	Standard Memory Manager	Standard Memory Manager function for Macintosh.	
ATPGetRequest	Standard Appletalk Manage	Standard Appletalk Manager function for Macintosh	

Table 2.22-7 Network Event Handler Information.

2.22.1.3.6 ATPError

ATPError interprets an error that occured with the AppleTalk network. The function call is ATPError(errCode). Table 2.22-8 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
errCode	int	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
ср	register pointer to char	Standard C type.
buf[100]	char	Standard C type.
	Calls	
Function	Where Described	
ShowCaution	See Section 2.22.1.4.1.	
	Called By	
Function	Where Described	
ATPPut	See Section 2.22.1.3.3.	
DownloadTerrainMap	See Section 2.22.1.3.4.	
NetworkEventHandler	See Section 2.22.1.3.5.	

Table 2.22-8 ATPError Information.

2.22.1.4 caution.c

Development:SIMNET:libmac:caution.c

caution.c contains routines for displaying an alert box containing a warning message.

2.22.1.4.1 ShowCaution

ShowCaution puts up an alert box with an arbitrary warning message, str. The function call is ShowCaution(str). Table 2.22-9 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
str	pointer to char	Standard C type.
	Internal Variabi	es
Variable	Type	Where Typedef Declared
d	DialogPtr	Development:THINK C: Mac #includes:DialogMgr.h
i	int	Standard C type.
theltem	Handle	Development:THINK C: Mac #includes:MacTypes.h
box	Rect	Development:THINK C: Mac #includes:MacTypes.h

Calls		
Function	Where Described	
SysBeep	Standard Operating System Utility function for Macintosh.	
ShowSimpleDialog	See Section 2.22.1.40.1.	
OutlineItem	See Section 2.22.1.27.2.	
GetDltem	Standard Dialog Manager function for Macintosh.	
SetiText	Standard Dialog Manager function for Macintosh.	
SetWRefCon	Standard Window Manager function for Macintosh.	
ShowWindow	Standard Window Manager function for Macintosh.	
	Called By	
Function	Where Described	
CheckMandatoryFields	See Section 2.22.1.13.1.	
showhelp	See Section 2.22.1.19.4.	
setuphtopic	See Section 2.22.1.19.16.	
DialogSeqPrev	See Section 2.22.1.39.5.	
CheckLastField	See Section 2.22.1.11.5.	
ATPError	See Section 2.22.1.3.6.	

Table 2.22-9 ShowCaution Information.

2.21.1.4.2 SimpleCautionEvent

SimpleCautionEvent is called when a simple dialog gets an event. The function call is SimpleCautionEvent(window, theEvent). Table 2.22-10 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Тура	Where Typedef Deciared
window	WindowPtr	Development:THINK C: Mac #includes:WindowMgr.h
theEvent	pointer to EventRecord	Development:THINK C: Mac #includes:EventMgr.h
	Internal Variables	
Variable	Type	Where Typedef Declared
itemHit	int	Standard C type.
	Calls	
Function	Where Described	
DialogSelect	Standard Dialog Manager function for Macintosh.	
DisposDialog	Standard Dialog Manager function for Macintosh.	
SysBeep	Standard Operating System Utility function for Macintosh.	

Table 2.22-10 SimpleCautionEvent Information.

2.21.1.4.3 LastCaution

LastCaution returns a WindowPtr pointing to the last CautionWindow. If you need to stick your new window behind the last caution box, then call NewWindow with LastCaution. The function call is LastCaution(). Table 2.22-11 describes the internal variables used and functions called using this function.

	Internal Variab	es
Variable	Туре	Where Typedef Declared
wPeek	WindowPeek	Development:THINK C: Mac #includes:WindowMgr.h
fPeek	WindowPeek	Development:THINK C: Mac #includes:WindowMgr.h
	Return Value	8
Return Value	Туре	Meaning
-1	WindowPtr	No caution boxes up.
fPeek	WindowPtr	Last caution window.
	Calls	
Function	Where Described	
GetWRefCon	Standard Window Man	ager function for Macintosh.
	Called By	
Function	Where Described	
ShowDialog	See Section 2.22.1.11	.1.
ShowSimpleDialog	See Section 2.22.1.40	0.1.
SetUpAppleTalk	See Section 2.22.1.3.	1.

Table 2,22-11 LastCaution Information.

2.22.1.4.4 CountCaution

CountCaution returns the number of caution boxes currently displayed. The function call is CountCaution(). Table 2.22-12 describes the internal variables used and functions called using this function.

	Internal Variab	les
Variable	Type	Where Typedef Declared
wPeek	WindowPeek	Development:THINK C: Mac #includes:WindowMgr.h
cnt	int	Standard C type.
	Return Value	
Return Value	Туре	Meaning
cnt	int	Number of caution boxes.
	Calls	
Function	Where Described	
GetWRefCon	Standard Window Manager function for Macintosh.	

Table 2.22-12 CountCaution Information.

2.22.1.5 clock.h

Development:SIMNET:libmac:clock.h

clock.h is the header file associated with the following file, clock.c(Section 2.22.1.6).

2.22.1.6 clock.c

Development:SIMNET:libmac:clock.c

clock.c contains routines for displaying the current date and time in the top right corner of the Macintosh screen. Table 2.22-13 describes the variables used by clock.c.

Variables			
Variable Type Where Typedef Declar			
clockPort	GrafPort	Development:THINK C: Mac #includes:Quickdraw.h	
lastMinute	unsigned long	Standard C type.	

Table 2.22-13 clock.c Variable Information.

2.22.1.6.1 DrawClock

DrawClock writes the current Date Time group, now, in the clock port in response to an update. The function call is DrawClock(now). Table 2.22-14 describes the parameters used and functions called using this function.

	Parameters		
Parameter	Туре	Where Typedef Declared	
now	unsigned long	Standard C type.	
 			
	Internal Variable		
Variable	Type	Where Typedef Declared	
tempPort	GrafPtr	Development:THINK C:	
		Mac #includes:Quickdraw.h	
dtg	DateTimeGroup	Development:SIMNET:libmac	
G	i '	dtg.h	
str[20]	char	Standard C type.	
	Calls		
Function	Where Described		
GetPort	Standard Quickdraw function for Macintosh.		
SetPort	Standard Quickdraw function for Macintosh.		
EraseRect	Standard Quickdraw function for Macintosh.		
FrameRect	Standard Quickdraw function for Macintosh.		
DTGElapsed	See Section 2.22.1.15.3.		
DTGToString		See Section 2.22.1.15.1.	
MoveTo		Standard Quickdraw function for Macintosh.	
DrawText	Standard Quickdraw function for Macintosh.		

Called By		
Function	Where Described	
UpdateClock	See Section 2.22.1.6.2.	
RedrawClock	See Section 2.22.1.6.3.	
InstallClock	See Section 2.22.1.6.4.	
SetClock	See Section 2.22.1.6.5.	

Table 2.22-14 DrawClock Information.

2.22.1.6.2 UpdateClock

UpdateClock updates the clock every minute. The function call is UpdateClock(). Table 2.22-15 describes the internal variable used and functions called using this function.

Internal Variables			
Variable	Type	Where Typedef Declared	
now	unsigned long	Standard C type.	
	Calls		
Function	Where Described		
GetDateTime	Standard Operating Sy	stem Utility function for Macintosh.	
DrawClock	See Section 2.22.1.6.1.		

Table 2.22-15 UpdateClock Information.

2.22.1.6.3 RedrawClock

RedrawClock redraws the clock with the current time. The function call is RedrawClock(). Table 2.22-16 describes the internal variable used and functions called using this function.

	internal Variabl	es
Variable	Type	Where Typedef Declared
now	unsigned long	Standard C type.
	Calls	
Function	Where Described	
GetDateTime	Standard Operating Sys	stem Utility function for Macintosh.
DrawClock	See Section 2.22.1.6.1.	

Table 2.22-16 RedrawClock Information.

2.22.1.6.4 InstallClock

InstallClock sets up the Clock GrafPort and displays the current time. The function call is InstallClock(). Table 2.22-17 describes the internal variable used and functions called using this function.

Internal Variables			
Variable Type Where Typedef Dec			
tempPort	GrafPtr	Development:THINK C: Mac #includes:Quickdraw.h	
now	unsigned long	Standard C type.	

Calls		
Function Where Described		
GetPort	Standard Quickdraw function for Macintosh.	
OpenPort	Standard Quickdraw function for Macintosh.	
PortSize	Standard Quickdraw function for Macintosh.	
MovePortTo	Standard Quickdraw function for Macintosh.	
SetPort	Standard Quickdraw function for Macintosh.	
GetDateTime	Standard Operating System Utility function for Macintosh.	
DrawClock	See Section 2.22.1.6.1.	

Table 2.22-17 InstallClock Information.

2.22.1.6.5 SetClock

SetClock sets the clock to the time *now*. The function call is SetClock(now). Table 2.22-18 describes the internal variable used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
now	unsigned long	Standard C type.
	Calls	<u> </u>
Function	Where Described	
SetDateTime	Standard Operating Sys	stem Utility function for Macintosh.
DrawClock	See Section 2.22.1.6.1.	

Table 2.22-18 SetClock Information.

2.22.1.7 control.c

Development:SIMNET:libmac:control.c

control.c contains routines for enabling and disabling controls within dialogs.

2.22.1.7.1 DisableControl

DisableControl disables a control within a dialog. dialog is the dialog that control is in; itemNo is the itemNo of the control. The function call is DisableControl(dialog, itemNo). Table 2.22-19 describes the parameters used and functions called using this function

	Paramete	rs
Parameter	Type	Where Typedef Declared
dialog	DialogPtr	Development:THINK C: Mac #includes:DialogMgr.h
itemNo	int	Standard C type
Variable	Type	Where Typedef Declared
<u>Variable</u>		
<u> </u>	int	Standard C type.
theltem	Handle	Development:THINK C:
		Mac #includes:MacTypes.h
box	Rect	Development:THINK C:
		Mac #includes MacTypes h

Calls		
Function	Where Described	
GetDltem	Standard Dialog Manager function for Macintosh.	
HiliteControl Standard Control Manager function for Macintosh.		
	Called By	
Function	Where Described	
LabelForceButtons	See Section 2.22.1.16.1.	

Table 2.22-19 DisableControl Information.

2.22.1.7.2 EnableControl

EnableControl enables a control within a dialog. The function call is EnableControl(dialog, itemNo). Table 2.22-20 describes the parameters used and functions called using this function.

	Paramete	rs
Parameter	Type	Where Typedef Declared
dialog	DialogPtr	Development:THINK C:
		Mac #includes:DialogMgr.h
itemNo	int	Standard C type.
	Internal Varia	bles
Variable	Туре	Where Typedef Declared
j	int	Standard C type.
theltem	Handle	Development:THINK C: Mac #includes:MacTypes.h
box	Rect	Development:THINK C: Mac #includes:MacTypes.h
	Calls	
Function	Where Described	
GetDitem		ager function for Macintosh.
HiliteControl	Standard Control Manager function for Macintosh.	
	Called By	
Function	Where Described	
LabelForceButtons	See Section 2.22.1.	16.1.

Table 2.22-20 EnableControl Information.

2.22.1.8 bigprob.c

Development:SIMNET:libmac:bigprob.c

bigprob.c contains routines for reporting unrecoverable errors.

2.22.1.8.1 SystemFailure

SystemFailure calls BipProb with a system error code. *errCode* is the error number of type of error; *place* is a string that describes where error occurred. The function call is SystemFailure(errCode, place). Table 2.22-21 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
errCode	int	Standard C type.
place	pointer to char	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
str	array of 256 char	Standard C type.
	Calls	
Function	Where Described	
BigProb	See Section 2.22.1.8.2.	
	Called By	
Function	Where Described	
SetUpAppleTalk	See Section 2.22.1.3.1.	

Table 2.22-21 SystemFailure Information.

2.22.1.8.2 BigProb

BigProb puts up an alert, s, and halts the program. The function call is BigProb(s). Table 2.22-22 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
S	pointer to char	Standard C type.
	Calls	
Function	Where Described	
ParamText	Standard Dialog Manager function for Macintosh.	
StopAlert	Standard Dialog Manager function for Macintosh.	
ExitToShell	Standard Segment Loader function for Macintosh.	
	Called By	
Function	Where Described	
SystemFailure	See Section 2.22.1.8.1.	
SetUpAppleTalk	See Section 2.22.1.3.1.	

Table 2.22-22 BigProb Information.

2.22.1.9 dialog.h

Development:SIMNET:libmac:dialog.h

dialog.h is the header file associated with the following files, which collectively provide support for dialog boxes.

2.22.1.10 dialine.c

Development:SIMNET:libmac:dialine.c

dialine.c contains routines for drawing lines and rectangles within dialogs.

2.22.1.10.1 DrawLine

DrawLine draws a line or a rectangle in a dialog box. The function call is DrawLine(w, itemNo). Table 2.22-23 describes the parameters used and functions called using this function.

Parameters			
Parameter	Type	Where Typedef Declared	
w	register WindowPtr	Development:THINK C:	
		Mac #includes:WindowMgr.h	
itemNo	int	Standard C type.	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
<u>i</u>	int	Standard C type.	
field	int	Standard C type.	
theltem	Handle	Development:THINK C:	
		Mac #includes:MacTypes.h	
r	Rect	Development:THINK C:	
		Mac #includes:MacTypes.h	
defn	register pointer to	Development:SIMNET:libmac:	
	LineFieldDefn	dialog.h	
pnState	PenState	Development:THINK C:	
		Mac #includes:Quickdraw.h	
	Calls		
Function	Where Described		
GetDitem		Standard Dialog Manager function for Macintosh.	
DialogLookupField		See Section 2.22.1.12.1.	
SetPort		Standard Quickdraw function for Macintosh.	
GetPenState		Standard Quickdraw function for Macintosh.	
PenSize		Standard Quickdraw function for Macintosh.	
PenMode	Standard Quickdraw funct	Standard Quickdraw function for Macintosh.	
PenPat	Standard Quickdraw funct	Standard Quickdraw function for Macintosh.	
MoveTo	Standard Quickdraw funct		
LineTo	Standard Quickdraw funct		
FrameRect	Standard Quickdraw funct	tion for Macintosh.	
SetPenState	Standard Quickdraw function for Macintosh.		

Table 2.22-23 DrawLine Information.

2.22.1.11 dialog.c

Development:SIMNET:libmac:dialog.c

dialog.c contains routines for initializing, discarding and checking the entries in dialogs, and for handling events associated with dialogs.

2.22.1.11.1 ShowDialog

ShowDialog is called to display a dialog box. The function call is ShowDialog(dStorage, defn). The function returns a pointer to DialogState, a structure defined in dialog.h. dStorage is the pointer to DialogState structure; defn is the pointer to DialogDefn structure. Table 2.22-24 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
dStorage	register Ptr	Development:THINK C:
		Mac #includes:MacTypes.h
defn	register pointer to DialogDefn	Development:SIMNET:libmac: dialog.h
		dialog.ii
	Internal Variables	
Variable	Туре	Where Typedef Declared
fpp	pointer to pointer to FieldDefn	Development:SIMNET:libmac: dialog.h
fnc	pointer to function that returns int	Standard C type.
i	int	Standard C type.
	int	Standard C type.
theltem	Handle	Development:THINK C:
		Mac #includes:MacTypes.h
box	Rect	Development:THINK C:
	- <u> </u>	Mac #includes:MacTypes.h
	Poturn Values	
Return Value	Return Values	Maaning

Called By		
Function	Where Described	
ShowDialogSeqNode	See Section 2.22.1.39.2.	

Table 2.22-24 ShowDialog Information.

2.22.1.11.2 UpdateDialog

UpdateDialog loads values into the editable fields of a dialog box specified by *dialog*. The function call is UpdateDialog(dialog). Table 2.22-25 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
dialog	register pointer to DialogState	Development:SIMNET:libmac: dialog.h	
	Internal Variables		
Variable	Type	Where Typedef Declared	
fpp	pointer to pointer to FieldDefn	Development:SIMNET:libmac: dialog.h	
field	int	Standard C type.	
i	int	Standard C type.	
theltem	Handle	Development:THINK C: Mac #includes:MacTypes.h	
box	Rect	Development:THINK C: Mac #includes:MacTypes.h

	Calls		
Function	Where Described		
GetDItem	Standard Dialog Manager funct		
SetCtlValue	Standard Control Manager function for Macintosh.		
SetiText	Standard Dialog Manager function for Macintosh.		
NumToString	Standard Binary to Decimal Conversion Package function for Macintosh.		
DTGToString	See Section 2.22.1.15.1.		
	Called By		
runction	Where Described	· · · · · · · · · · · · · · · · · · ·	
ShowDialog			
Showdialog	See Section 2.22.1.11.1.		

Table 2.22-25 UpdateDialog Information.

2.22.1.11.3 ThrowDialog

ThrowDialog removes a dialog, dialog, from the screen. The function call is ThrowDialog(dialog). Table 2.22-26 describes the parameter used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
dialog	register pointer to DialogState	Development:SIMNET:libmac: dialog.h
	Calls	
Function	Where Described	
CloseDialog	Standard Dialog Manager function for Macintosh.	
DisposHandle	Standard Memory Manager function for Macintosh.	
	Called By	
Function	Where Described	
DialogSegNext	See Section 2.22.1.39.4.	
DialogSeqPrev	See Section 2.22.1.39.5.	

Table 2.22-26 ThrowDialog Information.

2.22.1.11.4 DialogEvent

DialogEvent handles an event, the Event, within a dialog box, specified by dialog. window is the window in which the event occurred; the Event returns 0 if the event was invalid, otherwise it returns the itemNo of the control the event was about. The function call is DialogEvent(window, the Event). Table 2.22-27 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
window	register WindowPtr	Development:THINK C: Mac #includes:WindowMgr.h
theEvent	pointer to EventRecord	Development:THINK C: Mac #includes:EventMgr.h
	Internal Variables	
Variable	Type	Where Typedef Declared
defn	register pointer to DialogDefn	Development:SIMNET:libmac: dialog.h
itemNo	int	Standard C type.
field	int	Standard C type.
fpp	pointer to pointer to FieldDefn	Development:SIMNET:libmac: dialog.h
fp	pointer to FieldDefn	Development:SIMNET:libmac: dialog.h
theltem	Handle	Development:THINK C: Mac #includes:MacTypes.h
ctl	ControlHandle	Development:THINK C: Mac #includes.ControlMgr.h
ch	char	Standard C type.

	Return Val	ues
Return Value	Туре	Meaning
0	int	Unsuccessful.
itemNo	int	The resource id of the button pressed.
	Calls	
Function	Where Describe	d
SubPt	Standard Quickdray	v function for Macintosh.
DialogSelect	Standard Dialog Manager function for Macintosh.	
ScrollTableActivate	See Section 2.22.1.32.1.	
DialogLookupField	See Section 2.22.1.12.1.	
CheckLastField	See Section 2.22.1.11.5.	
SetRadioButton	See Section 2.22.1.11.6.	
SetCheckBox	See Section 2.22.1.11.7.	
FixTableEvent	See Section 2.22.1.42.3.	
ScrollTableEvent	See Section 2.22.1	1.32.2.
	Called B	у
Function	Where Describe	d
DialogSeqEvent	See Section 2.22.1.39.3.	

Table 2.22-27 DialogEvent Information.

2.22.1.11.5 CheckLastField

CheckLastField checks the syntax of the field just left. The function call is CheckLastField(dialog). Table 2.22-28 describes the parameters used, errors returned and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
fp	register pointer to FieldDefn	Development:SIMNET:libmac: dialog.h
i	int	Standard C type.
n	long	Standard C type.
theitem	Handle	Development:THINK C: Mac #includes:MacTypes.h
box	Rect	Development:THINK C: Mac #includes:MacTypes.h
ср	pointer to char	Standard C type.
cStr	pointer to char	Standard C type.

	Calls
Function	Where Described
GetDitem	Standard Dialog Manager function for Macintosh.
GetlText	Standard Dialog Manager function for Macintosh.
SellText	Standard Dialog Manager function for Macintosh.
ShowCaution	See Section 2.22.1.4.1.
StringToNum	Standard Binary to Decimal Conversion Package function for Macintosh.
StringToMapCoordinates	See Section 2.22.1.26.1.
SetIText	Standard Dialog Manager function for Macintosh.
StringToDTG	See Section 2.22.1.15.2.
<u></u>	Called By
Function	Where Described
DialogEvent	See Section 2.22.1.11.4.

Table 2.22-28 CheckLastField Information.

2.22.1.11.6 SetRadioButton

SetRadioButton sets a radio button on and the others in the group off. The function call is SetRadioButton(dialog, itemNo). Table 2.22-29 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
itemNo	int	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
fp	register pointer to RBFieldDefn	Development:SIMNET:libmac: dialog.h
fpp	pointer to pointer to FieldDefn	Development:SIMNET:libmac: dialog.h
i	int	Standard C type.
theltem	Handle	Development:THINK C: Mac #includes:MacTypes.h
box	Rect	Development:THINK C: Mac #includes:MacTypes.h
	Calls	
Function	Where Described	
DialogLookupField	See Section 2.22.1.12.1.	
GetDitem_	Standard Dialog Manager function for Macintosh.	
SetCtlValue	Standard Control Manager function for Macintosh.	
	Called By	
Function	Where Described	
DialogEvent	SeeSection 2.22.1.11.4.	

Table 2.22-29 SetRadioButton Information.

2.22.1.11.7 SetCheckBox

SetCheckBox sets a check box on or off. dialog points to the dialog check box is in; itemNo is the itemNo of check box; value states whether check box should be turned on or off. The function call is SetCheckBox(dialog, itemNo, value). Table 2.22-30 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac:
		dialog.h
itemNo	int	Standard C type.
value	int	Standard C type.
· · · · · · · · · · · · · · · · · · ·	Internal Variables	
Variable	Туре	Where Typedef Declared
fp	pointer to CBFieldDefn	Development:SIMNET:libmac: dialog.h
I	int	Standard C type.

Function	Where Described		
GetDitem	Standard Dialog Ma	nager function for Macintosh.	
SetIText		Standard Dialog Manager function for Macintosh.	

Table 2.22-31 SetText Information.

2.22.1.12 dialookup.c

Development:SIMNET:libmac:dialookup.c

dialookup.c contains a routine for locating a definition of a dialog field given its dialog item number.

2.22.1.12.1 DialogLookupField

DialogLookupField locates a field by item number. The function call is DialogLookupField(state, itemNo). Table 2.22-32 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
state	pointer to DialogState	Development:SIMNET:libmac.dialog.h
itemNo	int	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
fpp	pointer to pointer to FieldDefn	Development:SIMNET:libmac: dialog.h
i	register int	Standard C type
	Return Values	
Return Value	Туре	Meaning
-1	int	Not successful.
i	int	Field definition.

Called By		
Function	Where Described	
DrawLine	See Section 2.22.1.10.1.	
DrawFixTable	See Section 2.22.1.42.4.	
DialogEvent	See Section 2.22.1.11.4.	
SetRadioButton	See Section 2.22.1.11.6.	
SetCheckBox	See Section 2.22.1.11.7.	

Table 2.22-32 DialogLookupField Information.

2.22.1.13 diamand.c

Development:SIMNET:libmac:diamand.c

diamand.c contains a routine for ensuring that mandatory dialog fields are filled.

2.22.1.13.1 CheckMandatoryFields

CheckMandatoryFields ensures that all mandatory fields are filled in. *state* is the pointer to Dialog to be checked. The function call is CheckMandatoryFields(state). Table 2.22-33 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
state	register pointer to DialogState	Development:SIMNET:libmac: dialog.h
	internal Variables	
Variable	Туре	Where Typedef Declared
fpp	pointer to pointer to FieldDefn	Development:SIMNET:libmac: dialog.h
i	int	Standard C type.
theltem	Handle	Development:THINK C: Mac #includes:MacTypes.h
box	Rect	Development:THINK C: Mac #includes:MacTypes.h
str[256]	char	Standard C type.
	Return Values	
Return Value	Туре	Meaning
1	int	All mandatory fields filled in.
0	int	Mandatory field must be filled in.
	Calls	
Function	Where Described	
GetDItem	Standard Dialog Manager funct	ion for Macintosh.
GetIText	Standard Dialog Manager funct	
SellText	Standard Dialog Manager funct	ion for Macintosh.
ShowCaution	See Section 2.22.1.4.1.	
CtoPstr		

Table 2.22-33 CheckMandatoryFields Information.

2.22.1.14 dtg.h

Development:SIMNET:libmac:dtg.h

dtg.h is the header file associated with the following file, dtg.c(Section 2.22.1.15).

2.22.1.15 dtg.c

Development:SIMNET:libmac:dtg.c

dtg.c contains routines for input, output, and processing of date time groups. Table 2.22-34 describes the variables used by dtg.c.

	Variables	
Variable	Туре	Where Typedef Declared
currentTime	DateTimeGroup	Development:SIMNET:libmac: dtg.h
monthAbbrev[]	char	Standard C type.
monthLength[]	char	Standard C type.

Table 2.22-34 dtg.c Variable Information.

2.22.1.15.1 DTGToString

DTGToString generates a string, str, from a DateTimeGroup object, dtg. The function call is DTGToString(dtg, str). Table 2.22-35 describes the parameters used by this function.

	Parameters	
Parameter	Type	Where Typedef Declared
dtg	register pointer to DateTimeGroup	Development:SIMNET:libmac: dtg.h
str	register pointer to char	Standard C type.
	Called By	
Function	Where Described	
DrawClock	See Section 2.22.1.6.1.	
UpdateDialog	See Section 2.22.1.11.2.	

Table 2.22-35 DTGToString Information.

2.22.1.15.2 **StringToDTG**

StringToDTG converts a string, cp, to a DateTimeGroup object, dtg. The string is not expected to include a year, although the year must be specified in the DateTimeGroup object produced. So the appropriate year is deduced from the current time on the Macintosh. The function call is StringToDTG(cp, dtg). Table 2.22-36 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
ср	register pointer to char	Standard C type.
dtg	pointer to DateTimeGroup	Development:SIMNET:libmac. dtg.h

	Internal Variab	
Variable	Type	Where Typedef Declared
day	int	Standard C type.
time	int	Standard C type.
hour	int	Standard C type.
minute	int	Standard C type.
month	int	Standard C type.
monthName[4]	char	Standard C type.
	Return Value	
Return Value	Туре	Meaning
DTG_SUCCESS	int ≈ 0	DTG string parsed okay.
DTG_ERROR	int = 1	DTG string has lexical error.
DTG_BAD_DAY	int = 2	DTG day out of range.
DTG_BAD_HOUR	int ≈ 3	DTG hour out of range.
DTG_BAD_MINUTE	int = 4	DTG minute out of range.
	Calls	·
Function	Where Described	
GetDateTime	Standard Operating System Utility function for Macintosh.	
Secs2Date		stem Utility function for Macintosh.
Date2Secs	Standard Operating System Utility function for Macintosh.	
	Called By	
Function	Where Described	
CheckLastField	See Section 2.22.1.1	1.5.

Table 2.22-36 StringToDTG Information.

2.22.1.15.3 DTGElapsed

DTGElapsed sets a DateTimeGroup data object, dtg, from an elapsed time value, secs, (in seconds from Jan. 1, 1904). The function call is DTGElapsed(secs, dtg). Table 2.22-37 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
secs	unsigned long	Standard C type.
dtg	pointer to DateTimeGroup	Development:SIMNET:libmac: dtg.h
	Calls	
Function	Where Described	
Secs2Date	Standard Operating System I	Utility function for Macintosh.
	Called By	
Function	Where Described	
DrawClock	See Section 2.22.1.6.1.	

Table 2.22-37 DTGElapsed Information.

2.22.1.15.4 Get_DTG

Get_DTG retrieves the current time as a DateTimeGroup, dtg. The function call is Get_DTG(dtg). Table 2.22-38 describes the parameters used and functions called using this function.

	Parameters	_
Parameter	Туре	Where Typedef Declared
dtg	pointer to DateTimeGroup	Development:SIMNET:libmac: dtg.h
	Calls	
Function	Where Described	
GetDateTime	Standard Operating System t	Itility function for Macintosh
GCID ale Time	I Standard Operating System t	Stilly Idilottoff for Midolitosii.

Table 2.22-38 Get_DTG Information.

2.22.1.16 force.c

Development:SIMNET:libmac:force.c

force.c contains routines supporting the concept of forces (e.g., "US" and "Soviet").

2.22.1.16.1 LabelForceButtons

LabelForceButtons labels radio buttons that display a choice of forces. The *itemNo* passed is that of the first of three radio buttons, corresponding to force IDs 1, 2 and 3. The *battleScheme* parameter determines whether the first two buttons are labelled "Offense" and "Defense", or "US" and "Soviet". The *forceID* parameter specifies which button(s) is/are enabled. If it is forceIDIrrelevant or observerForceID, all three buttons are enabled. The function call is LabelForceButtons(dialog, itemNo, battleScheme, forceID). Table 2.22-39 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
dialog	DialogPtr	Development:THINK C: Mac #includes:DialogMgr.h
itemNo	int	Standard C type.
battleScheme	int	Standard C type.
forceID	int	Standard C type.
Variable	Туре	Where Typedef Declared
A	Internal Variabl	
i	lint	Standard C type.
theltem	Handle	Development:THINK C: Mac #includes:MacTypes.h
box	Rect	Development:THINK C: Mac #includes:MacTypes.h
titleA[]	pointer to char	Standard C type.
61107111		Standard C type.

Calls		
Function	Where Described	
GetDitem	Standard Dialog Manager function for Macintosh.	
SetCTitle	Standard Control Manager function for Macintosh.	
EnableControl	See Section 2.22.1.7.2.	
DisableControl	See Section 2.22.1.7.1.	

Table 2.22-39 LabelForceButtons Information.

2.22.1.16.2 ForceNamePStr

ForceNamePStr returns the name of a force under a particular battle scheme as a Pascal string. The function call is ForceNamePStr(forceID, battleScheme). The function call returns a pointer to a string. Table 2.22-40 describes the parameters used by this function.

	Parameters	_
Parameter	Type	Where Typedef Declared
forceID	int	Standard C type.
battleScheme	int	Standard C type.
	Deturn Velue	
	Return Values	* — .
Return Value	Type	Meaning
str	pointer to char	Name of force.

Table 2.22-40 ForceNamePStr Information.

2.22.1.17 help.h

Development:SIMNET:libmac:help.h

help.h is the header file defining the external interface to the following collection of help routines.

2.22.1.18 helplocal.h

Development:SIMNET:libmac:helplocal.h

helplocal.h is the header file containing internal definitions associated with the following collection of help routines.

2.22.1.19 help.c

Development:SIMNET:libmac:help.c

help.c contains routines providing user access to a database of help material. Table 2.22-41 describes the variables used by help.c.

Variables		
Variable	Туре	Where Typedef Declared
curhelp	int	Standard C type.
helpfid	int	Standard C type.
helphandle	Handle	Development:THINK C:
<u> </u>		Mac #includes:MacTypes.h

Table 2.22-41 help.c Variable Information.

2.22.1.19.1 helpinit

helpinit initializes the help facility. It is called once at program startup. The function call is helpinit(helpfile). Table 2.22-42 describes the parameters used, errors returned and functions called using this function. *helpfile* is the address of a pascal type string containing the name of the help resource file, if NIL is passed, no file will be opened and the help resources will be assumed to be in an already opened resource file.

Parameter	Type	Where Typedef Declared
helpfile	pointer to char	Standard C type.

	Internal Variable	es	
Variable	Туре	Where Typedef Declared	
curtopic	int	Standard C type.	
helpindex	int	Standard C type.	
helpid	int	Standard C type.	
initresult	int	Standard C type.	
mhlphdl	Handle	Development:THINK C: Mac #includes:MacTypes.h	
mhlpptr	pointer to char	Standard C type.	
orgcount	int	Standard C type.

DisposHandle		ager function for Macintosh.	
HUnlock	Standard Memory Mana	Standard Memory Manager function for Macintosh.	

Table 2.22.42 helpinit Information.

2.22.1.19.2 helpshutdown

helpshutdown shut down the help facility. The function call is helpshutdown(). Table 2.22-43 describes the internal variables used and functions called using this function.

Internal Variables		
Variable	Туре	Where Typedef Declared
contenthdl	Handle	Development:THINK C: Mac #includes:MacTypes.h
curien	unsigned int	Standard C type.
curpos	unsigned long	Standard C type.
curvar	pointer to char	Standard C type.
varslen	unsigned long	Standard C type.

Calls	
Function	Where Described
DisposHandle	Standard Memory Manager function for Macintosh.
GetHandleSize	Standard Memory Manager function for Macintosh.
CloseResFile	Standard Resource Manager function for Macintosh.

Table 2.22-43 helpshutdown Information.

2.22.1.19.3 sethelpvar

sethelpvar sets the contents of a help variable. The function call is sethelpvar(variable, varcontents). Table 2.22-44 describes the parameters used and functions called using this function. *variable* is a pointer to a string containing the variable name; *varcontents* is a pointer to a string containing the new contents for the variable.

	Parameters	
Parameter	Туре	Where Typedef Declared
variable	pointer to char	Standard C type.
varcontents	pointer to char	Standard C type.
	Internal Variabl	es
Variable	Туре	Where Typedef Declared
addlen	long	Standard C type.

LSetSelect	Standard List Manager function for Macintosh.	
LAutoScroll	Standard List Manager function for Macintosh.	
LActivate	Standard List Manager function for Macintosh.	
ShowWindow	Standard Window Manager function for Macintosh.	
SetWRefCon	Standard Dialog Manager function for Macintosh.	
	Called By	
Function	Where Described	
showhelp	See Section 2.22.1.19.4.	
htopicevents	See Section 2.22.1.19.14.	
setuphtopic	See Section 2.22.1.19.16.	

Table 2.22-49 setuphpick Information.

2.22.1.19.9 redrawhelp

redrawhelp redraws the chunks that are in the redraw area. The function call is redrawhelp(dptr, top, bottom). Table 2.22-50 describes the parameters used and functions called using this function. *dptr* is a pointer to the dialog containing the redraw area; *top* is the top of the area to redraw; *bottom* is the bottom of the area to redraw.

	Paramete	rs
Parameter	Туре	Where Typedef Declared
dptr	DialogPtr	Development:THINK C: Mac #includes:DialogMgr.h
top	int	Standard C type.
bottom	int	Standard C type.

	Internal Variabl	es
Variable	Туре	Where Typedef Declared
curchunk	int	Standard C type.
curorigin	int	Standard C type.

Table 2.22-52 scrollto Information.

2.22.1.19.12 trytoscroll

trytoscroll is called by TrackControl (indirectly) to try to scroll the topic by the amount specified. *dptr* is a pointer to the dialog containing control and *count* is the number of pixels to scroll the window. The function call is trytoscroll(dptr, count). Table 2.22-53 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
dptr	DialogPtr	Development:THINK C: Mac #includes:DialogPtr.h
count	int	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
neworigin	int	Standard C type.

<u> </u>		

Table 2.22-64 createhpict Information.

2.22.1.20 init.c

Development:SIMNET:libmac:init.c

init.c contains a routine for initializing the Macintosh toolbox.

2.22.1.20.1 InitToolbox

InitToolbox initializes the Macintosh toolbox. The function call is InitToolbox(masters, restartProc). Table 2.22-65 describes the parameters used and functions called using this function.

	Paramete	rs
Parameter	Туре	Where Typedef Declared
masters	int	Standard C type.
restartProc	ProcPtr	Development:THINK C: Mac #includes:MacTypes.h
	Calls	
Function	Where Described	
MaxApplZone	Standard Memory Manager function for Macintosh.	
MoreMasters	Standard Memory Manager function for Macintosh.	
InitGraf	Standard Quickdraw function for Macintosh.	
InitFonts	Standard Font Manager function for Macintosh.	
FlushEvents	Standard Operating Macintosh.	System Event Manager function for
InitWindows	Standard Window Manager function for Macintosh.	
TEInit		unction for Macintosh.
InitDialogs	Standard Dialog Mai	nager function for Macintosh.
InitCursor	Standard Quickdraw	function for Macintosh.
SetCursor	Standard Quickdraw	function for Macintosh.

Table 2.22-65 InitToolbox Information.

2.22.1.21 install.c

Development:SIMNET:libmac:install.c

install.c contains a routine for installing an entry into a scrolling table.

2.22.1.21.1 InstallScrollTableEntry

InstallScrollTableEntry either inserts or reinserts an entry, *entry*, into a scrolling table, specifed by *defn*. The function call is InstallScrollTableEntry(defn, entry). Table 2.22-66 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	register pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
entry	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h

	Internal Variables	
Variable	Туре	Where Typedef Declared
key	unsigned long	Standard C type.
oldRow	int	Standard C type.
newRow	int	Standard C type.
j	int	Standard C type.
r	Rect	Development:THINK C: Mac #includes:MacTypes.h
е	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
savePort	GrafPtr	Development:THINK C: Mac #includes:Quickdraw.h
	Calls	
Function	Where Described	
ScrollTableEntryToRow	See Section 2.22.1.34.2.	
NextPrev	Macro defined in select.c in Section 2.22.1.37.	
PrevNext	Macro defined in select.c in	Section 2.22.1.37.
SetCtlMax	Standard Control Manager f	unction for Macintosh.
GetPort	Standard Quickdraw functio	n for Macintosh.
SetPort	Standard Quickdraw functio	n for Macintosh.
InvalRect	Standard Window Manager	function for Macintosh.

Table 2.22-66 InstallScrollTableEntry Information.

2.22.1.22 longpt.h

Development:SIMNET:libmac:longpt.h

longpt.h defines data types for Cartesian points and rectangles represented using 32-bit integer coordinates.

2.22.1.23 longpt.c

Development:SIMNET:libmac:longpt.c

longpt.c contains routines for operating on points represented using 32-bit integer coordinates.

2.22.1.23.1 isqrt

isqrt is an integer square root algorithm. The alogrithm works by noting that the square root of an integer is the smallest of the two most nearly equal factors of that number, i.e. the 2 most equal roots of 255 are 15 and 17, and so 15 is the square of 255. The function call is isqrt(numb). Table 2.22-67 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
numb	register long	Standard C type.

	Internal Variables	
Variable	Туре	Where Typedef Declared
guess1	register long	Standard C type.
guess2	register long	Standard C type.
error	register long	Standard C type.
	Return Values	
Return Value	Туре	Meaning
guess1	register long	Square root.
numb	register long	numb is returned when negative because square root can not be computed.
	Called By	
Function	Where Described	
DistBetween2Pts	See Section 2.22.1.23.2.	

Table 2.22-67 isqrt Information.

2.22.1.23.2 DistBetween2Pts

DistBetween2Pts computes the distance between two points, ptl and pt2, using only integers. The function call is DistBetween2Pts(pt1, pt2). Table 2.22-68 describes the parameters used and functions called using this function.

	Parameter	s
Parameter	Type	Where Typedef Declared
pt1	LongPt	Development:SIMNET:libmac: longpt.h
pt2	LongPt	Development:SIMNET:libmac: longpt.h
	Return Value	es
Return Value	Type	Meaning
	long	Return value from called to isqrt.
	Colle	
	Calls	
Function	Where Described	
isqrt	See Section 2.22.1.2	23.1.

Table 2.22-68 DistBetween2Pts Information.

2.22.1.23.3 PercentPt

PercentPt locates a point, retPt, a given percentage distant, percent, between a start and an end point, points ptl and pt2. The function call is PercentPt(pt1, pt2, percent, retPt). Table 2.22-69 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
pt1	LongPt	Development:SIMNET:libmac: longpt.h
pt2	LongPt	Development:SIMNET:libmac: longpt.h
percent	long	Standard C type.
retPt	pointer to LongPt	Development:SIMNET:libmac: longpt.h

Table 2.22-69 PercentPt Information.

2.22.1.23.4 InterpolatePoints

InterpolatePoints locates the point some fraction of the way between two other points. The function call is InterpolatePoints(pt1, pt2, num, denom, ptInt). Table 2.22-70 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
pt1	pointer to LongPt	Development:SIMNET:libmac: longpt.h
pt2	pointer to LongPt	Development:SIMNET:libmac: longpt.h
num	long	Standard C type.
denom	long	Standard C type.
ptInt	pointer to LongPt	Development:SIMNET:libmac: longpt.h
	Internal Variable	S
Variable	Type	Where Typedef Declared
fract	float	Standard C type.

Table 2.22-70 InterpolatePoints Information.

2.22.1.23.5 SetLongPt

SetLongPt initializes a LongPt value. The function call is SetLongPt(pt, x, y). Table 2.22-71 describes the parameters used by this function.

Parameters Parameters Parameters Parameters Parameters Parameters Parameters Parameters Parameters Parameters		
Parameter	Type	Where Typedef Declared
pt	pointer to LongPt	Development:SIMNET:libmac: longpt.h
X	long	Standard C type.
у	long	Standard C type.

Table 2.22-71 SetLongPt Information.

2.22.1.24 lookup.c

Development:SIMNET:libmac:lookup.c

lookup.c contains a routine for locating an entry in a scrolling table.

2.22.1.24.1 LookupScrollTableEntry

LookupScrollTableEntry locates a scrolling table entry by its key. The function call is LookupScrollTableEntry(defn, key). Table 2.22-72 describes the parameters used by this function.

	Parameters	- 112
Parameter	Type	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
key	unsigned long	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
е	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
	Return Values	
Return Value	Туре	Meaning
е	register ScrollTableEntryHandle	Handle of scrolling table entry.

Table 2.22-72 LookupScrollTableEntry Information.

2.22.1.25 map.h

Development:SIMNET:libmac:map.h

map.h defines data types for representing the mapping between UTM coordinates and Cartesian world coordinates. Table 2.22-73 describes the variables used by map.h.

Variables		
Variable	Туре	Where Typedef Declared
terrainMap	extern TerrainMap	Development:SIMNET:libmac: map.h

Table 2.22-73 map.h Variable Information.

2.22.1.26 map.c

Development:SIMNET:libmac:map.c

map.c contains routines for converting between UTM coordinates and Cartesian world coordinates. Table 2.22-74 describes the variables used by map.c.

Variables		
Variable	Type	Where Typedef Declared
terrainMap	TerrainMap	Development:SIMNET:libmac: map.h
scale[]	long int	Standard C type.

Table 2.22-74 map.c Variable Information.

2.22.1.26.1 StringToMapCoordinates

StringToMapCoordinates parses a string, *str*, and converts it to a MapCoordinates object, *map*. The function call is StringToMapCoordinates(map, str). Table 2.22-75 describes the parameters used and errors returned using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
map	pointer to MapCoordinates	Development:SIMNET:libmac:	
·		map.h	
str	register pointer to char	Standard C type.	
	internal Variables		
Variable	Туре	Where Typedef Declared	
atol()	extern function returning long	Standard C type.	
i	register short	Standard C type.	
ch	register short	Standard C type.	
zone	register pointer to GridZone	Development:SIMNET:libmac: map.h	
prec	short	Standard C type.	
pt	LongPt	Development:SIMNET:libmac: longpt.h	
xStr[6]	char	Standard C type.	
	Return Values		
Return Value	Туре	Meaning	
-1	int	badMapStringErr	
-2	int	badMapLetterErr	
-3	int	outOfGridZoneErr	
0	int	Successful	
	Errors		
Error Name	Reason for Error		
badMapStringErr	String too long or contains wro		
badMapLetterErr		String letter pair doesn't designate a correct grid zone.	
outOfGridZoneErr	Coordinates are not within given grid zone.		

Called By		
Function	Where Described	
CheckLastField	See Section 2.22.1.11.5.	

Table 2.22-75 StringToMapCoordinates Information.

2.22.1.26.2 PointToMapCoordinates

PointToMapCoordinates builds a MapCoordinates object from a set of Cartesian coordinates identifying a point on the terrain. The function call is PointToMapCoordinates(map, pt, prec). Table 2.22-76 describes the parameters used and errors returned using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
map	register pointer to	Development:SIMNET:libmac:
	MapCoordinates	map.h
pt	pointer to LongPt	Development:SIMNET:libmac:
		longpt.h
prec	int	Standard C type.
	Internal Variables	<u> </u>
Variable	Туре	Where Typedef Declared
i	register short	Standard C type.
n	register long	Standard C type.
ср	register pointer to char	Standard C type.
р	LongPt	Development:SIMNET:libmac: longpt.h
zone	pointer to GridZone	Development:SIMNET:libmac: map.h
punctuate	short	Standard C type.
	Return Values	
Return Value	Туре	Meaning
-4	int	noGridZoneErr
0	int	Successful
	Errors	
Error Name	Reason for Error	
noGridZoneErr	Grid zone not present.	

Table 2.22-76 PointToMapCoordinates Information.

2.22.1.27 outline.c

Development:SIMNET:libmac:outline.c

outline.c contains routines for outlining a dialog's default button.

2.22.1.27.1 DrawItemOutline

DrawItemOutline is the draw procedure, called by the Dialog Manager. w is the pointer to the window the item is in; *itemNo* is the number of the item to be outlined. The function call is DrawItemOutline(w, itemNo). Table 2.22-77 describes the parameters used and functions called using this function.

	Parameter:	\$	
Parameter	Туре	Where Typedef Declared	
W	WindowPtr	Development:THINK C: Mac #includes:WindowMgr.h	
itemNo	int	Standard C type.	
	Internal Varial	nlee	
Variable			
variable	Туре	Where Typedef Declared	
l .	int	Standard C type.

r	Rect	Development:THINK C: Mac #includes:MacTypes.h	
	Calls		
Function	Where Described	Where Described	
GetDltem	Standard Dialog Mana	Standard Dialog Manager function for Macintosh.	
SetPort	Standard Quickdraw function for Macintosh.		
PenNormal	Standard Quickdraw f	unction for Macintosh.	
PenSize	Standard Quickdraw f	unction for Macintosh.	
FrameRoundRect	Standard Quickdraw function for Macintosh.		

Table 2.22-77 DrawItemOutline Information.

2.22.1.27.2 OutlineItem

OutlineItem is called to tie a drawing function to userItem. The function call is OutlineItem(dialog, itemNo). Table 2.22-78 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
dialog	register DialogPtr	Development:THINK C: Mac #includes:DialogMgr.h
itemNo	int	Standard C type.
Variable	Type	Where Typedef Declared
<u></u>	Internal Variables	
:		
1	int	Standard C type.
	1 1 1 a a a d 1 a	
theltem	Handle	Development:THINK C: Mac #includes:MacTypes.h
r	Rect	Mac #includes:MacTypes.h Development:THINK C:
r		Mac #includes:MacTypes.h

Calls		
Function	Where Described	
GetDitem	Standard Dialog Manager function for Macintosh.	
InsetRect	Standard Quickdraw function for Macintosh.	
GetHandleSize	Standard Memory Manager function for Macintosh.	
SetHandleSize	Standard Memory Manager function for Macintosh.	
MemError	Standard Memory Manager function for Macintosh.	
	Called By	
Function	Where Described	
ShowCaution	See Section 2.22.1.4.1.	
ShowDialog	See Section 2.22.1.11.1.	
showhelp	See Section 2.22.1.19.4.	
ShowSimpleDialog	See Section 2.22.1.40.1.	

Table 2.22-78 OutlineItem Information.

2.22.1.28 remove.c

Development:SIMNET:libmac:remove.c

remove.c contains a routine for removing an entry from a scrolling table.

2.22.1.28.1 RemoveScrollTableEntry

RemoveScrollTableEntry removes an entry, e, from a table, specified by defn, and discards it. The function call is RemoveScrollTableEntry(defn, e). Table 2.22-79 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	register pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
е	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
savePort	GrafPtr	Development:THINK C: Mac #includes:Quickdraw.h
row	int	Standard C type.
i	int	Standard C type.
r	Rect	Development:THINK C: Mac #includes:MacTypes.h
		mac #includes:MacTypes.n

Calls	
Function	Where Described
DisposHandle	Standard Memory Manager function for Macintosh.
GetPort	Standard Quickdraw function for Macintosh.
SetPort	Standard Quickdraw function for Macintosh.
SetCtlMax	Standard Control Manager function for Macintosh.
InvalRect	Standard Window Manager function for Macintosh.
ScrollTableEntryToRow	See Section 2.22.1.34.2.
NextPrev	Macro defined in remove.c in Section 2.22.1.28.
PrevNext	Macro defined in remove.c in Section 2.22.1.28.
	Calls
Function	Where Described
EmptyScrollTable	See Section 2.22.1.28.2.

Table 2.22-79 RemoveScrollTableEntry Information.

2.22.1.28.2 EmptyScrollTable

EmptyScrollTable removes all entries from a scrolling table, *defn*. The function call is EmptyScrollTable(defn). Table 2.22-80 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	register pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
	Internal Variables	
Variable	Type	Where Typedef Declared
е	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
	Calls	
Function	Where Described	
RemoveScrollTableEntry	See Section 2.22.1.28.1.	

Table 2.22-80 EmptyScrollTable Information.

2.22.1.29 scroll.h

Development:SIMNET:libmac:scroll.h

scroll.h is the header file associated with the following files which collectively provide support for scrolling tables within dialog boxes.

2.22.1.30 scroll.c

Development:SIMNET:libmac:scroll.c

scroll.c contains routines for creating and discarding scrolling tables. Table 2.22-81 describes the variables used by scroll.c.

Variables		
Variable	Туре	Where Typedef Declared
DrawScrollTable()	extern pascal void	

Table 2.22-81 scroll.c Variable Information.

2.22.1.30.1 ShowScrollTable

ShowScrollTable prepares a scrolling table field, specified by *defn*, of a new dialog box, *dialog*. The function call is ShowScrollTable(dialog, defn). Table 2.22-82 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
defn	register pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
savePort	GrafPtr	Development:THINK C: Mac #includes:Quickdraw.h
col	register pointer to ScrollTableColunDefn	Development:SIMNET:libmac: scroll.h
С	short	Standard C type.
W	short	Standard C type.
hSize	short	Standard C type.
vSize	short	Standard C type.
•	int	Standard C type.
box	Rect	Development:THINK C: Mac #includes:MacTypes.h
theitem	Handle	Development:THINK C: Mac #includes:MacTypes.h
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h

Calls	
Function	Where Described
GetPort	Standard Quickdraw function for Macintosh.
SetPort	Standard Quickdraw function for Macintosh.
TextFont	Standard Quickdraw function for Macintosh.
TextSize	Standard Quickdraw function for Macintosh.
GetFontInfo	Standard Quickdraw function for Macintosh.
GetDltem	Standard Dialog Manager function for Macintosh.
StringWidth	Standard Quickdraw function for Macintosh.
SetDItem	Standard Dialog Manager function for Macintosh.
NewControl	Standard Control Manager function for Macintosh.
NewHandle	Standard Memory Manager function for Macintosh.
	Called By
Function	Where Described
ShowDialog	See Section 2.22.1.11.1.

Table 2.22-82 ShowScrollTable Information.

2.22.1.30.2 DisposeScrollTable

DisposeScrollTable discards the storage occupied by a scrolling table, *defn*. The function call is DisposeScrollTable(defn). Table 2.22-83 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	register pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
	Internal Variables	
Variable	Type	Where Typedef Declared
e1	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
e2	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
	Calls	
Function	Where Described	
DisposHandle	Standard Memory Manager	function for Macintosh.
DisposeControl	Standard Control Manager function for Macintosh.	

Table 2.22-83 DisposeScrollTable Information.

2.22.1.31 scrolldraw.c

Development:SIMNET:libmac:scrolldraw.c

scrolldraw.c contains routines for drawing scrolling tables.

2.22.1.31.1 UpdateScrollTableEntry

UpdateScrollTableEntry forces a redraw of an entry, entry, in a scrolling table, specified by defn. The function call is UpdateScrollTableEntry(defn, entry). Table 2.22-84 describes the parameters used and functions called using this function.

	Parameters		
Parameter	Туре	Where Typedef Declared	
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h	
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h	
	Internal Variables		
Variable	Type	Where Typedef Declared	
row	int	Standard C type.	
savePort	GrafPtr	Development:THINK C:	
		Mac #includes:Quickdraw.h	
box	Rect	Development:THINK C:	
		Mac #includes:MacTypes.h	
	Calls		
Function	Where Described	Where Described	
ScrollTableEntryToRow	See Section 2.22.1.34.2.		
ScrollTableRowRect	See Section 2.22.1.34.3.		
GetPort	Standard Quickdraw function	n for Macintosh.	
SetPort	Standard Quickdraw function		
InvalRect	Standard Window Manager function for Macintosh.		

Table 2.22-84 UpdateScrollTableEntry Information.

2.22.1.31.2 DrawScrollTable

DrawScrollTable draws a scrolling table field of a dialog box. The function call is DrawScrollTable(w, itemNo). Table 2.22-85 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
W	WindowPtr	Development:THINK C: Mac #includes:WindowMgr.h
itemNo	int	Standard C type.
Variable	Internal Variables Type	Where Typedef Declared
	Internal Variables	
field	short	Standard C type.
	Calls	
Function	Where Described	
DrawScrollTableC	SeeSection 2.22.1.31.3.	

Table 2.22-85 DrawScrollTable Information.

2.22.1.31.3 DrawScrollTableC

DrawScrollTableC draws a scrolling table field of a dialog box. The function call is DrawScrollTableC(defn). Table 2.22-86 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	register pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
	internal Variables	
Variable	Туре	Where Typedef Declared
row	int	Standard C type.
pos	int	Standard C type.
topMargin	int	Standard C type.
bottomMargin	int	Standard C type.
leftMargin	int	Standard C type.
rightMargin	int	Standard C type.
С	register int	Standard C type.
i	register int	Standard C type.
col	register pointer to ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
box	Rect	Development:THINK C: Mac #includes:MacTypes.h
сВох	Rect	Development:THINK C: Mac #includes:MacTypes.h
controlDef	Handle	Development:THINK C: Mac #includes:MacTypes.h
pnState	PenState	Development:THINK C: Mac #includes:Quickdraw.h

Calls		
Function	Where Described	
GetPenState	Standard Quickdraw function for Macintosh.	
PenNormal	Standard Quickdraw function for Macintosh.	
TextFont	Standard Quickdraw function for Macintosh.	
TextSize	Standard Quickdraw function for Macintosh.	
TextFace	Standard Quickdraw function for Macintosh.	
EraseRect	Standard Quickdraw function for Macintosh.	
InsetRect	Standard Quickdraw function for Macintosh.	
FrameRect	Standard Quickdraw function for Macintosh.	
CallPascalL		
MoveTo	Standard Quickdraw function for Macintosh.	
PenPat	Standard Quickdraw function for Macintosh.	
Line	Standard Quickdraw function for Macintosh.	
DrawString	Standard Quickdraw function for Macintosh.	
LineTo	Standard Quickdraw function for Macintosh.	
HLock	Standard Memory Manager function for Macintosh.	
RectinRgn	Standard Quickdraw function for Macintosh.	
HUnlock	Standard Memory Manager function for Macintosh.	
SetPenState	Standard Quickdraw function for Macintosh.	
Called By		
Function	Where Described	
DrawScrollTable	See Section 2.22.1.31.2.	
ScrollTableBoxScroll	See Section 2.22.1.32.7.	

Table 2.22-86 DrawScrollTableC Information.

2.22.1.31.4 HiliteScrollTableSelection

HiliteScrollTableSelection is a hilite function that inverts a row. *defn* is the pointer to ScrollTable; *entry* is the entry of ScrollTable; *box* is the coordinates of ScrollTable entry box to be hilited. The function call is HiliteScrollTableSelection(defn, entry, box). Table 2.22-87 describes the parameters used and function called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
box	pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h
	Calls	
Function	Where Described	
InvertRect	Standard Quickdraw functio	n for Macintosh.

Table 2.22-87 HiliteScrollTableSelection Information.

2.22.1.32 scrollevt.c

Development:SIMNET:libmac:scrollevt.c

scrollevt.c contains routines for handling events related to scrolling tables. Table 2.22-88 describes the variables used by scrollevt.c.

Variables		
Variable	Туре	Where Typedef Declared
scroliDefn	pointer to	Development:SIMNET:libmac:
	ScrollTableFieldDefn	scroll.h

Table 2.22-88 scrollevt.c Variable Information.

2.22.1.32.1 ScrollTableActivate

ScrollTableActivate handles an activate event in a scrolling table. The function call is ScrollTableActivate(defn, theEvent). Table 2.22-89 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
defn	register pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
theEvent	pointer to EventRecord	Development:THINK C: Mac #includes:EventMgr.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
savePort	GrafPtr	Development:THINK C: Mac #includes:Quickdraw.h
		
	Calls	
Function	Where Described	
GetPort	Standard Quickdraw functio	n for Macintosh.
SetPort	Standard Quickdraw functio	
InvalRect	Standard Window Manager	function for Macintosh.
ShowControl	Standard Control Manager f	
HideControl	Standard Control Manager f	
	Called By	
Function	Where Described	
DialogEvent	See Section 2.22.1.11.4.	

Table 2.22-89 ScrollTableActivate Information.

2.22.1.32.2 ScrollTableEvent

ScrollTableEvent handles a mouse-down event in a scrolling table. The function call is ScrollTableEvent(defn, theEvent). Table 2.22-90 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	register pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
theEvent	pointer to EventRecord	Development:THINK C: Mac #includes:EventMgr.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
P	Point	Development:THINK C:
•		Mac #includes:MacTypes.h
i	int	Standard C type.
box	Rect	Development:THINK C:
		Mac #includes:MacTypes.h
	Calls	
Function	Where Described	
SetPort	Standard Quickdraw functio	n for Macintosh.
GlobalToLocal	Standard Quickdraw functio	n for Macintosh.
ScrollTableScrollBarEvent	See Section 2.22.1.32.3.	
	Called By	
Function	Where Described	
DialogEvent	See Section 2.22.1.11.4.	

Table 2.22-91 ScrollTableEvent Information.

2.22.1.32.3 ScrollTableScrollBarEvent

ScrollTableScrollBarEvent handles a mouse-down in the scroll bar. The function call is ScrollTableScrollBarEvent(defn, where). Table 2.22-92 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
defn	register pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
where	Point	Development:THINK C: Mac #includes:MacTypes.h
	Internal Variable	S
Variable	Туре	Where Typedef Declared
theControl	ControlHandle	Development:THINK C: Mac #includes:ControlMgr.h

Calls	
Function Where Described	
FindControl	Standard Control Manager function for Macintosh.
TrackControl	Standard Control Manager function for Macintosh.
ScrollTablePage	SeeSection 2.22.1.32.6.
ScrollTableBoxScroll	See Section 2.22.1.32.7.
	Called By
Function	Where Described
ScrollTableEvent	See Section 2.22.1.32.2.

Table 2.22-92 ScrollTableScrollBarEvent Information.

2.22.1.32.4 ScrollTableUp

ScrollTableUp is called from TrackControl while the up-arrow is moused. *theControl* points to the scroll control; *partCode* says whether the mouse was hit in the up-arrow section of the control. The function call is ScrollTableUp(theControl, partCode). Table 2.22-93 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
theControl	ControlHandle	Development:THINK C: Mac #includes:ControlMgr.h
partCode	short	Standard C type.
	Calls	
Function	Where Described	
SetCtlValue	Standard Control Mana	ger function for Macintosh.
ScrollTableBoxScroll	See Section 2.22.1.32	2.7.

Table 2.22-93 ScrollTableUp Information.

2.22.1.32.5 ScrollTableDown

ScrollTableDown is called from TrackControl while the down-arrow is moused. The function call is ScrollTableDown(theControl, partCode). Table 2.22-94 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
theControl	ControlHandle	Development:THINK C: Mac #includes:ControlMgr.h
partCode	short	Standard C type.
	Calls	
Function	Where Described	
SetCtlValue	Standard Control Mana	ger function for Macintosh.
ScrollTableBoxScroll	See Section 2.22.1.32	.7.

Table 2.22-94 ScrollTableDown Information.

2.22.1.32.6 ScrollTablePage

ScrollTablePage scrolls the table by a page. The function call is ScrollTablePage(partCode). Table 2.22-95 describes the parameters used and functions called using this function.

	Parameters	-
Parameter	Type	Where Typedef Declared
partCode	int	Standard C type.
	Internal Variabl	Ac
Variable	Туре	Where Typedef Declared
r	pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h
i	int	Standard C type.
where	Point	Development:THINK C: Mac #includes:MacTypes.h
	Calls	
Function	Where Described	
GetMouse	Standard Toolbox Ever	nt Manager function for Macintosh.
TestControl	Standard Control Mana	ger function for Macintosh.
SetCtlValue	Standard Control Mana	ger function for Macintosh.
GetCtlValue	Standard Control Mana	ger function for Macintosh.
ScrollTableBoxScroll	See Section 2.22.1.32	2.7.
StillDown	Standard Toolbox Ever	nt Manager function for Macintosh.
	Called By	
Function	Where Described	
ScrollTableScrollBarEvent	See Section 2.22.1.32	2.3.

Table 2.22-95 ScrollTablePage Information.

2.22.1.32.7 ScrollTableBoxScroll

ScrollTableBoxScroll redraws a scrolled table. The function call is ScrollTableBoxScroll(defn). Table 2.22-96 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
defn	register pointer to ScrollTableFieldDefn	Development:SIMNET:libmac scroll.h
Variable	Internal Variables	
Variable	Type	Where Typedef Declared
oldTopRow	int	Standard C type.
box	Rect	Development:THINK C: Mac #includes:MacTypes.h
tempRgn	RgnHandle	Development:THINK C: Mac #includes:Quickdraw.h

Calls		
Function	Where Described	
GetCtlValue	Standard Control Manager function for Macintosh.	
NewRgn	Standard Quickdraw function for Macintosh.	
SetPort	Standard Quickdraw function for Macintosh.	
ScrollRect	Standard Quickdraw function for Macintosh.	
InvalRgn	Standard Window Manager function for Macintosh.	
BeginUpdate	Standard Window Manager function for Macintosh.	
DrawScrollTableC	See Section 2.22.1.31.3.	
EndUpdate	Standard Window Manager function for Macintosh.	
	Called By	
Function	Where Described	
ScrollTableScrollBarEvent	See Section 2.22.1.32.3.	
ScrollTableUp	See Section 2.22.1.32.4.	
ScrollTableDown	See Section 2.22.1.32.4.	
ScrollTablePage	See Section 2.22.1.32.6.	
SelectScrollTableEntry	See Section 2.22.1.37.1.	

Table 2.22-96 ScrollTableBoxScroll Information.

2.22.1.33 scrollmap.c

Development:SIMNET:libmac:scrollmap.c

scrollmap.c contains a routine that invokes a specified function on each entry in a scrolling table.

2.22.1.33.1 MapScrollTableSelected

MapScrollTableSelected calls a supplied function for each selected entry in a scrolling table. *defn* is a pointer to the structure of scroll table; *inc* points to a function to call for each selection; *backward* is true if selection extends backwards. The function call is MapScrollTableSelected(defn, fnc, backward). Table 2.22-97 describes the parameters used by this function.

Parameters			
Parameter	Type	Where Typedef Declared	
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h	
(fnc)()	pointer to function that returns int	Standard C type	
backward	int Standard C type.		
	Internal Variables		
Variable	Туре	Where Typedef Declared	
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h	
selection	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h	
i	int	Standard C type.	

Table 2.22-97 MapScrollTableSelected Information

2.22.1.34 scrollrow.c

Development:SIMNET:libmac:scrollrow.c

scrollrow.c contains routines for mapping between scrolling table entries and the rows at which they are displayed.

2.22.1.34.1 ScrollTableRowToEntry

ScrollTableRowToEntry maps a table row number to an entry. The function call is ScrollTableRowToEntry(defn, row). Table 2.22-98 describes the parameters used and functions called using this function.

Parameters				
Parameter	Туре	Where Typedef Declared		
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h		
row	int	Standard C type.		
	Internal Variables			
Variable	Туре	Where Typedef Declared		
е	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h		
	Delum Values			
	Return Values			
Return Value	Туре	Meaning		
0	ScrollTableEntryHandle	Unsuccessful		
e	ScrollTableEntryHandle	Handle of entry.		
	Called By			
Function	Where Described			
SelectScrollTableEntry	See Section 2.22.1.37.1.			

Table 2.22-98 ScrollTableRowToEntry Information.

2.22.1.34.2 ScrollTableEntryToRow

ScrollTableEntryToRow maps an entry to a table row number. If the entry is not displayed, -1 is returned. The function call is ScrollTableEntryToRow(defn, e). Table 2.22-99 describes the parameters used by this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmad scroll.h	
е	ScrollTableEntryHandle	Development:SIMNET:libmac scroll.h	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
row	int	Standard C type.	

Return Values			
Return Value	Туре	Meaning	
row	int	Table row number.	
-1	int	Entry not displayed.	
	Called By		
Function	Where Described		
InstallScrollTableEntry	See Section 2.22.1.21.1.		
RemoveScrollTableEntry	See Section 2.22.1.28.1.		
UpdateScrollTableEntry	See Section 2.22.1.31.1.		
ZoomScrollTableEntry	See Section 2.22.1.36.1.		
SetScrollTableSelection	See Section 2.22.1.37.2.		

Table 2.22-99 ScrollTableEntryToRow Information.

2.22.1.34.3 ScrollTableRowRect

ScrollTableRowRect computes a rectangle surrounding a row of a table. The function call is ScrollTableRowRect(defn, row,box). Table 2.22-100 describes the parameters used by this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h	
row	int	Standard C type.	
box	pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h	
	Called By		
Function	Where Described		
UpdateScrollTableEntry	See Section 2.22.1.31.1.		
ZoomScrollTableEntry	See Section 2.22.1.36.1.	•	
InvertScrollTableRow	See Section 2.22.1.37.4.		

Table 2.22-100 ScrollTableRowRect Information.

2.22.1.35 scrollto.c

Development:SIMNET:libmac:scrollto.c

scrollto.c contains a routine for scrolling a table to bring a particular row into view.

2.22.1.35.1 ScrollToShow

ScrollToShow scrolls a table to show a particular entry. It returns the new row number of the entry, after any necessary scrolling. The function call is ScrollToShow(defn, entry). Table 2.22-101 describes the parameters used and functions called using this function.

Parameters				
Parameter	Туре	Where Typedef Declared		
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h		
entry	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h		
<u> </u>	Internal Variables			
Variable	Туре	Where Typedef Declared		
newTop	register short	Standard C type.		
n	register short	Standard C type.		
maxTop	short	Standard C type.		
savePort	GrafPtr	Development:THINK C: Mac #includes:Quickdraw.h		
	Return Values	·		
Return Value	Туре	Meaning		
n-defn->topRow	int	New row number of entry.		
	Calls			
Function	Where Described			
SetCtlValue	Standard Control Manager	function for Macintosh.		
GetPort	Standard Quickdraw function	n for Macintosh.		
SetPort	Standard Quickdraw function	n for Macintosh.		
InvalRect	Standard Window Manager	function for Macintosh.		

Table 2.22-101 ScrollToShow Information.

2.22.1.36 scrollzoom.c

Development:SIMNET:libmac:scrollzoom.c

scrollzoom.c contains a routine for "zoom" animating between a scrolling table entry and a pop-up window representing its contents.

2.22.1.36.1 ZoomScrollTableEntry

ZoomScrollTableEntry zooms between a table entry and a pop-up window. *defn* is a pointer to scroll table definition; *entry* is the entry that pop-up will describe; *window* is a pointer to a pop-up window; *zoomUp* is true if the pop-up window should be on top and false if the scroll table should be on top. The function call is ZoomScrollTableEntry(defn, entry, window, zoomUp). Table 2.22-102 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
entry	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
window	WindowPtr	Development:THINK C: Mac #includes:WindowMgr.h
zoomUp	int	Standard C type.
	Internal Variables	

Variable	Туре	Where Typedef Declared
row	int	Standard C type.
box	Rect	Development:THINK C: Mac #includes:MacTypes.h
	Calls	
Function	Where Described	
HideWindow	Standard Window Manager function for Macintosh.	
ScrollTableEntryToRow	See Section 2.22.1.34.2.	
ScrollTableRowRect	See Section 2.22.1.34.3	3.
ZoomToWindow	See Section 2.22.1.47.4	4.
ShowWindow	Standard Window Manager function for Macintosh.	

Table 2.22-102 ZoomScrollTableEntry Information.

2.22.1.37 select.c

Development:SIMNET:libmac:select.c

select.c contains routines for processing mouse events in a scrolling table.

2.22.1.37.1 SelectScrollTableEntry

SelectScrollTableEntry is called when the mouse is depressed within a scrolling table. *defn* is a pointer to scroll table structure; *row* is the row of the scroll table that was pressed; *modifiers* indicates which, if any, keys were pressed at the same time as the mouse down. The function call is SelectScrollTableEntry(defn, row, modifiers). Table 2.22-103 describes the parameters used, errors returned and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	register pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
row	int	Standard C type.
modifiers	int	Standard C type.

Internal Variables			
Variable	Туре	Where Typedef Declared	
entry	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h	
e1	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h	
minExtentEntry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h	
maxExtentEntry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h	
i	int	Standard C type.	
sense	int	Standard C type.	
inSelection	int	Standard C type.	
oldInSelection	int	Standard C type.	
minExtentRow	int	Standard C type.	
maxExtentRow	int	Standard C type.	
originalRow	int	Standard C type.	
limit	int	Standard C type.	
pt	Point	Development:THINK C: Mac #includes:MacTypes.h	
	Calls		
Function	Where Described		
ScrollTableRowToEntry	See Section 2.22.1.34.1.		
SetScrollTableSelection	See Section 2.22.1.37.2.	<u> </u>	
InvertScrollTableRow	See Section 2.22.1.37.4.		
StillDown	Standard Toolbox Event Ma	nager function for Macintosh.	
GetMouse		nager function for Macintosh.	
GetCtlMin	Standard Control Manager fu		
SetCtlValue	Standard Control Manager fu		
ScrollTableBoxScroll	See Section 2.22.1.32.7.		

Table 2.22-103 SelectScrollTableEntry Information.

2.22.1.37.2 SetScrollTableSelection

SetScrollTableSelection sets the current selection to a particular entry. The function call is SetScrollTableSelection(defn, entry). Table 2.22-104 describes the parameters used, errors returned and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
defn	register pointer to ScrollTableFieldDefn	Development:SIMNET:libmad scroll.h	
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
row	short	Standard C type.	

Calls		
Function	Where Described	
CancelScrollTableSelection	See Section 2.22.1.37.3.	
ScrollTableEntryToRow	See Section 2.22.1.34.2.	
InvertScrollTableRow	See Section 2.22.1.37.4.	
	Called By	
Function	Where Described	
SelectScrollTableEntry	See Section 2.22.1.37.1.	

Table 2.22-104 SetScrollTableSelection Information.

2.22.1.37.3 CancelScrollTableSelection

CancelScrollTableSelection cancels any current selections in a scrolling table, *defn*. The function call is CancelScrollTableSelection(defn). Table 2.22-105 describes the parameters used, and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	register pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
	Internal Variables	
Variable	Type	Where Typedef Declared
е	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
row	int	Standard C type.
	Calls	· · · · · · · · · · · · · · · · · · ·
Function	Where Described	
InvertScrollTableRow	See Section 2.22.1.37.4.	
	Called By	
Function	Where Described	
SetScrollTableSelection	See Section 2.22.1.37.2.	

Table 2.22-105 CancelScrollTableSelection Information.

2.22.1.37.4 InvertScrollTableRow

InvertScrollTableRow inverts the hiliting of a scrolling table row. The function call is InvertScrollTableRow(defn, row). Table 2.22-106 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac scroll.h
row	int	Standard C type.

	Internal Variables		
Variable	Туре	Where Typedef Declared	
saveport	GrafPtr	Development:THINK C:	
		Mac #includes:Quickdraw.h	
7	Rect	Development:THINK C:	
		Mac #includes:MacTypes.h	
	Calls		
Function	Where Described	Where Described	
ScrollTableRowRect	See Section 2.22.1.34.3.		
GetPort	Standard Quickdraw function for Macintosh.		
SetPort	Standard Quickdraw function for Macintosh.		
InvertRect	Standard Quickdraw function for Macintosh.		
	Called By		
Function	Where Described		
SelectScrollTableEntry	See Section 2.22.1.37.1.	See Section 2.22.1.37.1.	
SetScrollTableSelection	See Section 2.22.1.37.2.		
CancelScrollTableSelection	See Section 2.22.1.37.3.		

Table 2.22-106 InvertScrollTableRow Information.

2.22.1.37.5 FirstScrollTableSelection

FirstScrollTableSelection returns the handle to the first selected entry in a scrolling table. The function call is FirstScrollTableSelection(defn). Table 2.22-107 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
е	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
	Return Values	
Return Value	Туре	Meaning
0	ScrollTableEntryHandle	No selected entry.
е	ScrollTableEntryHandle	Handle of selected entry.

Table 2.22-107 FirstScrollTableSelection Information.

2.22.1.37.6 RemoveScrollTableSelected

RemoveScrollTableSelected removes currently selected entries from a scrolling table. The function call is RemoveScrollTableSelected(defn). Table 2.22-108 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
defn	register pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
e1	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h	
e2	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h	
i	int	Standard C type.	
row	int	Standard C type.

	Calls		
Function	Where Described		
GetPort		Standard Quickdraw function for Macintosh.	
SetPort		Standard Quickdraw function for Macintosh.	
SetCtlMax		Standard Control Manager function for Macintosh.	
SetCtlValue		Standard Control Manager function for Macintosh.	
InvalRect		Standard Window Manager function for Macintosh.	
NextPrev	Macro defined in select.c in		
PrevNext	Macro defined in select.c in		
DisposHandle	Standard Memory Manager function for Macintosh.		

Table 2.22-108 RemoveScrollTableSelected Information.

2.22.1.38 sequence.h

Development:SIMNET:libmac:sequence.h

sequence.h header file associated with the following file, sequence.c(Section 2.22.1.39).

2.22.1.39 sequence.c

Development:SIMNET:libmac:sequence.c

sequence.c contains routines providing sequencing among dialogs with provisions for backing up in a sequence and taking alternate branches.

2.22.1.39.1 StartDialogSeq

StartDialogSeq puts up the first dialog in a sequence of dialogs. *sStorage* is a pointer to dialog storage; *first* is a pointer to the first dialog in the sequence; *terminate* is a function that is called when the dialog sequence is finished. The function is a pointer to DialogSeqState. The function call is StartDialogSeq(sStorage, first, terminate). Table 2.22-109 describes the parameters used and functions called using this function.

Parameters Parameters		
Parameter	Туре	Where Typedef Declared
sStorage	Ptr	Development:THINK C: Mac #includes:MacTypes.h
first	pointer to DialogNodeDefn	Development:SIMNET:libmac: sequence.h
(terminate)()	pointer to function returning int	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
state	pointer to DialogSeqState	Development:SIMNET:libmac: sequence.h
	Return Values	
Return Value	Туре	Meaning
state	pointer to DialogSeqState	State of dialog sequence.
	Calls	
Function	Where Described	
NewPtr	Standard Memory Manager fu	nction for Macintosh
ShowDialogSeqNode	See Section 2.22.1.39.2.	

Table 2.22-109 StartDialogSeq Information.

2.22.1.39.2 ShowDialogSeqNode

ShowDialogSeqNode puts up a dialog box in the context of a sequence of dialog boxes. *state* is the structure defining the state of this sequence; *node* is the current node in this sequence. The function call is ShowDialogSeqNode(state, node). Table 2.22-110 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
state	pointer to DialogSeqState	Development:SIMNET:libmac: sequence.h	
node	pointer to DialogNodeDefn	Development:SIMNET:libmac: sequence.h	
	Calls		
Function	Where Described		
ShowDialog	See Section 2.22.1.11.1.		
ShowWindow	Standard Window Manager fu	Standard Window Manager function for Macintosh.	
SetWRefCon	Standard Window Manager function for Macintosh.		

Called By		
Function	Where Described	
StartDialogSeq	See Section 2.22.1.39.1.	

Table 2.22-110 ShowDialogSeqNode Information.

2.22.1.39.3 DialogSeqEvent

DialogSeqEvent handles an event in a dialog box member of a sequence. The function call is DialogSeqEvent(window, theEvent). Table 2.22-111 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
window	WindowPtr	Development:THINK C:
		Mac #includes:WindowMgr.h
theEvent	pointer to EventRecord	Development:THINK C:
· · · · · · · · · · · · · · · · · · ·		Mac #includes:EventMgr.h
	Internal Wantables	
Manlahla	Internal Variables	Indiana Tanada Daglarad
Variable	Туре	Where Typedef Declared
state	pointer to DialogSeqState	Development:SIMNET:libmac:
itemNo	int	sequence.h
		Standard C type.
nextNode	pointer to DialogNodeDefn	Development:SIMNET:libmac: sequence.h
		Sequence.ii
	Return Values	
Return Value	Туре	Meaning
0	int	Successful.
	Calls	·····
Function	Where Described	
DialogEvent	See Section 2.22.1.11.4.	
DialogSeqNext	See Section 2.22.1.39.4.	
DialogSeqPrev	See Section 2.22.1.39.5.

2.22.1.39.4 DialogSeqNext

DialogSeqNext goes forward in a dialog sequence. The function call is DialogSeqNext(state, node). Table 2.22-112 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
state	register pointer to DialogSeqState	Development:SIMNET:libmac: sequence.h
node	pointer to DialogNodeDefn	Development:SIMNET:libmac: sequence.h
	Calls	
Function	Where Described	
ThrowDialog	See Section 2.22.1.11.3.	
DialogSeqEvent	See Section 2.22.1.39.3.	
	Called By	
Function	Where Described	
DialogSeqEvent	See Section 2.22.1.39.3.	

Table 2.22-112 DialogSeqNext Information.

2.22.1.39.5 DialogSeqPrev

DialogSeqPrev backs up in a dialog sequence. The function call is DialogSeqPrev(state). Table 2.22-113 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
state	register pointer to DialogSeqState	Development:SIMNET:libmac: sequence.h
	Calls	
Function	Where Described	
ShowCaution	See Section 2.22.1.4.1.

DialogSeqEvent	See Section 2.22.1.39.3.	
	Called By	
Function	Where Described	
DialogSeqEvent	See Section 2.22.1.39.3.	

Table 2.22-113 DialogSeqPrev Information.

2.22.1.40 simple.c

Development:SIMNET:libmac:simple.c

simple.c contains routines implementing dialogs used to display informational messages.

2.22.1.40.1 ShowSimpleDialog

ShowSimpleDialog displays a dialog described by a DLOG resource. The function call is ShowSimpleDialog(resourceID). Table 2.22-114 describes the parameters used functions called using this function.

Parameters				
Parameter	Туре	Where Typedef Declared		
resourceID	int	Standard C type.		
	_			
	Internal Varial			
Variable	Type	Where Typedef Declared		
d	DialogPtr	Development:THINK C:		
		Mac #includes:DialogMgr.h		
	Return Value	es		
Return Value	Туре	Meaning		
d	DialogPtr	The dialog specified by the		
		resource id.		
	Calis			
Function	Where Described			
GetNewDialog		ager function for Macintosh.

Table 2.22-114 ShowSimpleDialog Information.

2.22.1.40.2 SimpleDialogEvent

SimpleDialogEvent is called when a simple dialog gets an event. The function call is SimpleDialogEvent(window, theEvent). Table 2.22-115 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
window	WindowPtr	Development:THINK C: Mac #includes:WindowMgr.h
theEvent	pointer to EventRecord	Development:THINK C: Mac #includes:EventMgr.h

	Internal Vari	ables
Variable	Туре	Where Typedef Declared
itemHit	int	Standard C type.
	Calls	
Function	Where Describe	d
DialogSelect	Standard Dialog Manager function for Macintosh.	
DisposDialog	Standard Dialog Manager function for Macintosh.	
SysBeep	Standard Operating System Utility function for Macintosh.	

Table 2.22-115 SimpleDialogEvent Information.

2.22.1.41 table.h

Development:SIMNET:libmac:table.h

table.h header file associated with the following file, table.c(Section 2.22.1.42).

2.22.1.42 table.c

Development:SIMNET:libmac:table.c

table.c contains routines implementing fixed-length (non-scrolling) tables within dialog boxes.

2.22.1.42.1 ShowFixTable

ShowFixTable prepares a fixed length table field of a new dialog box. The function call is ShowFixTable(dialog, defn). Table 2.22-116 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:llbmac: dialog.h
defn	register pointer to FixTableFieldDefn	Development:SIMNET:libmac: table.h
	Internal Variables	
Variable	Type	Where Typedef Declared

	Calls		
Function	Where Described		
GetDItem	Standard Dialog Manager fu	nction for Macintosh.	
DialogLookupField	See Section 2.22.1.12.1.		
GetPenState	Standard Quickdraw functio	n for Macintosh.	
PenNormal	Standard Quickdraw functio	n for Macintosh.	
TextFont	Standard Quickdraw functio	n for Macintosh.	
TextFaceSize	Standard Quickdraw function	n for Macintosh.	
EraseRect	Standard Quickdraw functio	n for Macintosh.	
InsetRect	Standard Quickdraw functio	n for Macintosh.	
FrameRect	Standard Quickdraw functio	n for Macintosh.	
MoveTo	Standard Quickdraw functio	n for Macintosh.	
PenPat	Standard Quickdraw function	n for Macintosh.	
Line	Standard Quickdraw function	n for Macintosh.	
StringWidth	Standard Quickdraw function		
DrawString	Standard Quickdraw functio		
LineTo	Standard Quickdraw function		
SetRect	Standard Quickdraw functio		
SetPenState	Standard Quickdraw function		

Table 2.22-119 DrawFixTable Information.

2.22.1.42.5 FixTableRowRect

FixTableRowRect computes a rectangle surrounding a single row of a table. The function call is FixTableRowRect(defn, row, box). Table 2.22-120 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	register pointer to FixTableFieldDefn	Development:SIMNET:libmac: table.h
row	int	Standard C type.
box	register pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h
Variable	Internal Variables	Where Typedef Declared
Variable	Type Internal Variables	Where Typedef Declared
i	int	Standard C type.
theltem	Handle	Development:THINK C: Mac #includes:MacTypes.h
	Calls	
Function	Where Described	
GetDitem	Standard Dialog Manager for	unction for Macintosh.

Table 2.22-120 FixTableRowRect Information.

2.22.1.43 title.c

Development:SIMNET:libmac:title.c

title.c contains a routine for displaying a title string in the menu bar.

2.22.1.43.1 MenuBarTitle

MenuBarTitle writes a title string, str, centered, in the menu bar. The function call is MenuBarTitle(str). Table 2.22-121 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
str	pointer to char	Standard C type.
	<u>Internal Variabl</u>	es
Variable	Type	Where Typedef Declared
savePort	GrafPtr	Development:THINK C: Mac #includes:Quickdraw.h
screenPort	GrafPtr	Development:THINK C: Mac #includes:Quickdraw.h
finfo	FontInfo	Development:THINK C: Mac #includes:Quickdraw.h
r	Rect	Development:THINK C: Mac #includes:MacTypes.h

Calls		
Function	Where Described	
GetPort	Standard Quickdraw function for Macintosh.	
OpenPort	Standard Quickdraw function for Macintosh.	
GetFontInfo	Standard Quickdraw function for Macintosh.	
EraseRect	Standard Quickdraw function for Macintosh.	
MoveTo	Standard Quickdraw function for Macintosh.	
StringWidth	Standard Quickdraw function for Macintosh.	
DrawString	Standard Quickdraw function for Macintosh.	
SetPort	Standard Quickdraw function for Macintosh.	

Table 2.22-121 MenuBarTitle Information.

2.22.1.44 version.c

Development:SIMNET:libmac:version.c

version.c contains routines for displaying a dialog identifying the versions of files comprising the current application.

2.22.1.44.1 Show Versions

ShowVersions puts up a dialog listing the open resource files and the version string from each. The function call is ShowVersions(). Table 2.22-122 describes the functions called using this function.

	Internal Varial	oles
Variable	Туре	Where Typedef Declared
hdì	Handle	Development:THINK C:
		Mac #includes:MacTypes.h
i	int	Standard C type.
d	DialogPtr	Development:THINK C:
		Mac #includes:DialogMgr.h
box	Rect	Development:THINK C:
		Mac #includes:macTypes.h
versions[256]	char	Standard C type.
	-	
	Calls	
Function	Where Described	
GetIndResource	Standard Resource Manager function for Macintosh.	
AppendString	See Section 2.22.1.44.2.	
ShowSimpleDialog	See Section 2.22.1.40.1.	
GetDitem	Standard Dialog Manager function for Macintosh.	
SetiText	Standard Dialog Manager function for Macintosh.	
ShowWindow	Standard Window Manager function for Macintosh.	

Table 2.22-122 ShowVersions Information.

2.22.1.44.2 AppendString

AppendString appends two character strings, s1 and s2. The function call is AppendString(s1, s2). Table 2.22-123 describes the parameters used and function called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
s1	pointer to char	Standard C type.
s2	pointer to char	Standard C type.
	Calls	
Function	Where Described	
BlockMove	Standard Memory Manager function for Macintosh.	
	Called By	
Function	Where Described	
ShowVersions	See Section 2.22.1.44.1.	

Table 2.22-123 AppendString Information.

2.22.1.45 wait.c

Development:SIMNET:libmac:wait.c

wait.c contains routines to put up alert boxes with wait messages. Table 2.22-124 describes the variables used by wait.c.

Variables			
Variable Type Where Typedef Declared			
waitDialog	WindowRecord	Development:THINK C: Mac #includes:WindowMgr.h	

Table 2.22-124 wait.c Variable Information.

2.22.1.45.1 ShowWait

ShowWait puts up a dialog with a wait message, message. The function call is ShowWait(message). Table 2.22-125 describes the parameter used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
message	pointer to char	Standard C type.
	Internal Variabl	es
Variable	Туре	Where Typedef Declared
box	Rect	Development:THINK C: Mac #includes:MacTypes.h
savePort	GrafPtr	Development:THINK C: Mac #includes:Quickdraw.h
buffer[4096]	char	Standard C type.

Calls		
Function	Where Described	
SetCursor	Standard Quickdraw function for Macintosh.	
GetCursor	Standard Toolbox Utility function for Macintosh.	
SetRect	Standard Quickdraw function for Macintosh.	
NewWindow	Standard Window Manager function for Macintosh.	
GetPort	Standard Quickdraw function for Macintosh.	
SetPort	Standard Quickdraw function for Macintosh.	
TextFont	Standard Quickdraw function for Macintosh.	
SetRect	Standard Quickdraw function for Macintosh.	
TextBox	Standard TextEdit function for Macintosh.	

Table 2.22-125 ShowWait Information.

2.22.1.45.2 ThrowWait

ThrowWait closes the dialog window with the wait message and puts up the arrow cursor. The function call is ThrowWait(). Table 2.22-126 describes the functions called using this function.

Calls		
Function	Where Described	
CloseWindow	Standard Menu Manager function for Macintosh.	
SetCursor	Standard Quickdraw function for Macintosh.	

Table 2.22-126 ThrowWait Information.

2.22.1.46 window.c

Development:SIMNET:libmac:window.c

window.c contains routines for generic handling of events associated with windows. Table 2.22-127 describes the variables used by window.c.

Variables			
Variable Type Where Typedef Decia			
menuHandler	ProcPtr	Development:THINK C: Mac #includes:MacTypes.h	

Table 2.22-127 window.c Variable Information.

2.22.1.46.1 SetMenuHandler

SetMenuHandler provides a routine, *hdler*, to field menu events. The function call is SetMenuHandler(hdler). Table 2.22-128 describes the parameter used by this function.

Parameters		
Parameter	Type	Where Typedef Declared
hdier	ProcPtr	Development:THINK C:
		Mac #includes:MacTypes.h

Table 2.22-128 SetMenuHandler Information.

2.22.1.46.2 WindowEvent

Window Event figures out which window an event has occured in, and calls the event handler for that window. If the event represents the selection of a menu item, a long word is returned defined as for the Toolbox function MenuSelect, otherwise zero is returned. The function call is WindowEvent(theEvent). Table 2.22-129 describes the parameter used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
theEvent	register pointer to	Development:THINK C:
	EventRecord	Mac #includes:EventMgr.h
	Internal Variable	
Variable	Type	Where Typedef Declared
menultem	unsigned long	Standard C type.
window	WindowPtr	Development:THINK C:
		Mac #includes:WindowMgr.h
	Calls	
Function	Where Described	
FindWindow	Standard Window Manager function for Macintosh.	
MenuSelect	Standard Menu Manager function for Macintosh.	
SystemClick	Standard Desk Manager function for Macintosh.	
MenuKey	Standard Menu Manager function for Macintosh.	
FrontWindow	Standard Window Manager function for Macintosh.	
GetWRefCon	Standard Window Manager function for Macintosh.	

Table 2.22-129 WindowEvent Information.

2.22.1.47 zoom.c

Development:SIMNET:libmac:zoom.c

zoom.c contains routines for "zoom" animating between a rectangle and a window. Table 2.22-130 describes the variables used by zoom.c.

Variables		
Variable	Type	Where Typedef Declared
deskPort	GrafPort	Development:THINK C: Mac #includes:Quickdraw.h

Table 2.22-130 zoom.c Variable Information.

2.22.1.47.1 ZoomInit

ZoomInit is called once before any calls to ZoomRect. The function call is ZoomInit(). Table 2.22-131 describes the functions called using this function.

Internal Variables			
Variable	Туре	Where Typedef Declared	
savePort	GrafPtr	Development:THINK C: Mac #includes:Quickdraw.h	
	Calls		
Function	Where Described		
GetPort	Standard Quickdraw function for Macintosh.		
OpenPort	Standard Quickdraw function for Macintosh.		
PenPat	Standard Quickdraw function for Macintosh.		
PenMode	Standard Quickdraw function for Macintosh.		
SetPort	Standard Quickdraw function for Macintosh.		

Table 2.22-131 ZoomInit Information.

2.22.1.47.2 ZoomRect

ZoomRect is given two rectangles in global coordinates and interpolates on into the other, making a zooming rectangle image on the screen. The rectangles and the screen image are not altered. *smallRect* is the coordinates of the smaller box; *bigRect* is the coordinates of the bigger box; *zoomUp* is *true* if zooming from small box to big box. The function call is ZoomRect(smallRect, bigRect, zoomUp). Table 2.22-132 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
smallRect	pointer to Rect	Development:THINK C:
		Mac #includes:MacTypes.h
bigRect	pointer to Rect	Development:THINK C:
		Mac #includes:MacTypes.h
zoomUp	int	Standard C type.
	Internal Variabl	es
Variable	Туре	Where Typedef Declared
savePort	GrafPtr	Development:THINK C
		Mac #includes:Quickdraw.h
rect1	Rect	Development:THINK C:
		Mac #includes:MacTypes.h
rect2	Rect	Development:THINK C:
		Mac #includes:MacTypes.h
rect3	Rect	Development:THINK C:
		Mac #includes:MacTypes.h
rect4	Rect	Development:THINK C:
		Mac #includes:MacTypes.h
fract	Fixed	Development:THINK C:
		Mac #includes:MacTypes.h
factor	Fixed	Development:THINK C:
		Mac #includes:MacTypes.h
İ	int	Standard C type.

Calls		
Function	Where Described	
GetPort	Standard Quickdraw function for Macintosh.	
SetPort	Standard Quickdraw function for Macintosh.	
FixRatio	Standard Toolbox Utility function for Macintosh.	
FrameRect	Standard Quickdraw function for Macintosh.	
SetRect	Standard Quickdraw function for Macintosh.	
Blend	See Section 2.22.1.47.3.	
FixMul	Macro defined in zoom.c.	
Called By		
Function	Where Described	
ZoomToWindow	See Section 2.22.1.47.4.	

Table 2.22-132 ZoomRect Information.

2.22.1.47.3 Blend

Blend interpolates one step in zooming from one rectangle to another. *smallCoord* is the coordinates of the smaller rectangle; *bigCoord* is the coordinates of the bigger rectangle. The function call is Blend(smallCoord, bigCoord, fract). Table 2.22-133 describes the parameters used and functions called using this function.

Parameters			
Parameter	Type	Where Typedef Declared	
smallCoord	int	Standard C type.	
bigCoord	int	Standard C type.	
fract	Fixed	Development:THINK C:	
		Mac #includes:MacTypes.h	
	Internal Varia	bles	
Variable	Type	Where Typedef Declared	
smallFix	Fixed	Development:THINK C:	
		Mac #includes:MacTypes.h	
bigFix	Fixed	Development:THINK C:	
		Mac #includes:MacTypes.h	
tempFix	Fixed	Development:THINK C:	
		Mac #includes:MacTypes.h	
		·	
	Return Valu		
Return Value	Туре	Meaning	
S	int	DDP socket number	
	Calls		
Function_	Where Described		
FixMul	Macro defined in zoom.c.		
FixRound	Standard Toolbox Utility function for Macintosh.		
	Called By		
Function	Where Described		
ZoomRect	See Section 2.22.1.	47.2.	

Table 2.22-133 Blend Information.

2.22.1.47.4 ZoomToWindow

ZoomToWindow zooms between a rectangle within one window and the frame of another window. The function call is ZoomToWindow(window1, rect1, window2, zoomUp). Table 2.22-134 describes the parameters used and functions called using this function.

Parameters			
Parameter	Type	Where Typedef Declared	
window1	WindowPtr	Development:THINK C: Mac #includes:WindowMgr.h	
rect1	pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h	
window2	register WindowPtr	Development:THINK C: Mac #includes:WindowMgr.h	
zoomUp	int	Standard C type.	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
smallRect	Rect	Development:THINK C: Mac #includes:MacTypes.h	
bigRect	Rect	Development:THINK C: Mac #includes:MacTypes.h	
	register int	Standard C type.	
	Calls		
Function	Where Described		
ZoomRect	See Section 2.22.1.47.2.		
	Called		
Function	Where Described		
ZoomScrollTableEntry	See Section 2.22.1.36.1.		

Table 2.22-134 ZoomToWindow Information.

2.22.2 libsim

Folder: "Development:SIMNET:MCC:libsim"

This folder contains a library of C functions supporting the placement and reconstitution of vehicle simulators. The library is used by both the SCC and Vehicle Placement Console Macintosh applications. The library is composed from the following files:

2.22.2.1 libsim.h

Development:SIMNET:MCC:libsim:libsim.h

libsim.h defines the external interface to the libsim library. Table 2.22-135 describes the variables used by libsim.h.

Variables		
Variable	Type	Where Typedef Declared
terrainBounds	extern LongRect	Development:SIMNET:libmac: longpt.h
battleScheme	extern char	Standard C type.
mccForceID	extern char	Standard C type.
companyRole	extern array of char	Standard C type.
simulators	extern array of SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h
pastSimulators	extern array of SavedDefaults	Development:SIMNET:MCC: libsim:libsim.h

Table 2.22-135 libsim.h Variable Information.

2.22.2.2 libsim int.h

Development:SIMNET:MCC:libsim:libsim_int.h

limsim_int.h contains definitions used within the libsim library. Table 2.22-136 describes the variables used by libsim_int.h.

Variables			
Variable	Туре	Where Typedef Declared	
libsimStandaloneVersion	extern char	Standard C type.	
simulatorTypes	extern array of	Development:SIMNET:MCC:	
	SimulatorTypeData	libsim:libsim_int.h	
placeBuffer	extern SimPlaceData	Development:SIMNET:MCC: libsim:libsim_int.h	
detailBuffer	extern SimVehicleStatus	Development:SIMNET:MCC: include:sim_xact.h	
placeDialog	extern pointer to DialogState	Development:SIMNET:libmac: dialog.h	
detailDialog	extern pointer to DialogState	Development:SIMNET:libmac: dialog.h	
vehCancelField	extern PushButtonFieldDefn	Development:SIMNET:libmac: dialog.h	
vehBumperField	extern NumberFieldDefn	Development:SIMNET:libmac: dialog.h	
vehBowField	extern NumberFieldDefn	Development:SIMNET:libmac: dialog.h	
vehTeamAField	extern RBFieldDefn	Development:SIMNET:libmac: dialog.h	
vehTeamBField	extern RBFieldDefn	Development:SIMNET:libmac: dialog.h	
vehObserverField	extern RBFieldDefn	Development:SIMNET:libmac: dialog.h	
vehRectField	extern RectFieldDefn	Development:SIMNET:libmac: dialog.h	
vehLocationField	extern CoordinatesFieldDefn	Development:SIMNET:libmac: dialog.h	

Table 2.22-136 libsim_int.h Variable Information.

2.22.2.3 atalk.c

Development:SIMNET:MCC:libsim:atalk.c

atalk.c contains routines for transferring information about vehicle simulators between the MCC host and a Macintosh.

2.22.2.3.1 DownloadSimulators

DownloadSimulators obtains information about the vehicle simulators available for inclusion in the exercise. The function call is DownloadSimulators(). Table 2.22-137 describes the internal variables used and functions called using this function.

Internal Variables			
Variable	Туре	Where Typedef Declared	
i	register int	Standard C type.	
sim	register pointer to SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h	
req	SimExistsRequest	Development:SIMNET:MCC: include:sim_xact.h	
rsp	SimExistsResponse	Development:SIMNET:MCC: include:sim_xact.h	
rtn	int	Standard C type.	
	Calls		
Function	Where Described		
ATPPut	See Section 2.22.1.3.3.		
PointToMapCoordinates	See Section 2.22.1.26.2.		

Table 2.22-137 DownloadSimulators Information.

2.22.2.3.2 Upload Vehicle Parameters

UploadVehicleParameters tells the host about a vehicle placement. Vehicle parameters are obtained from the structure supplied. The function call is UploadVehicleParameters(sim, data). Table 2.22-138 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
sim	register pointer to SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h
data	register pointer to SimPlaceData	Development:SIMNET:MCC: libsim:libsim_int.h
<u></u>	Internal Variable	
	Internal Variable	
Variable	Type	Where Typedef Declared
req	SimInitRequest	Development:SIMNET MCC: include:sim_xact.h
		D 1 OUNTER MOO
rsp	SimInitResponse	Development:SIMNET:MCC: include:sim_xact.h
rsp	SiminitHesponse	

Return Values			
Return Value	Туре	Meaning	
0	int	Unsuccessful.	
1	int	Successful.	
	Calls		
Function	Where Described		
ATPPut	See Section 2.22.1.3.3.		
PointToMapCoordinates	See Section 2.22.1.26.2.		
ShowCaution	See Section 2.22.1.4.1.		
	Called By	 	
Function	Where Described		
CompleteVehicleDialog	See Section 2.22.2.9.6.		

Table 2.22-138 UploadVehicleParameters Information.

2.22.2.3.3 DownloadVehicleParameters

DownloadVehicleParameters obtains the latest vehicle data from the host. The vehicle parameters are placed in the structure supplied. The function call is DownloadVehicleParameters(sim, data). Table 2.22-139 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
sim	register pointer to SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h	
data	register pointer to SimPlaceData	Development:SIMNET:MCC: libsim:libsim_int.h	
	internal Variables		
Variable	Туре	Where Typedef Declared	
req	SimQueryRequest	Development:SIMNET:MCC: include:sim_xact.h	
rsp	SimQueryResponse	Development:SIMNET:MCC: include:sim_xact.h	
	short	Standard C type.	
	Return Values		
Return Value	Туре	Meaning	
0	int	Unsuccessful.	
1	int	Successful.	

Calls		
Function	Where Described	
ATPPut	See Section 2.22.1.3.3.	
ShowCaution	See Section 2.22.1.4.1.	
PointToMapCoordinates	See Section 2.22.1.26.2.	
	Called By	
Function	Where Described	
ShowVehicleDialog	See Section 2.22.2.9.5.	

Table 2.22-139 DownloadVehicleParameters Information.

2.22.2.3.4 ProcessSimPlacedRequest

ProcessSimPlacedRequest processes a transaction from the host indicating that a simulator has been placed by another console. The function call is ProcessSimPlacedRequest (req). Table 2.22-140 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
req	register pointer to SimPlacedRequest	Development_SIMNET:MCC: include:sim_xact.h	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
sim	register pointer to SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h	
	Calls		
Function	Where Described		
PointToMapCoordinates	See Section 2.22.1.26.2.		

Table 2.22-140 ProcessSimPlacedRequest Information.

2.22.2.4 data.c

Development:SIMNET:MCC:libsim:data.c

data.c defines data structures associated with the libsim library, such as tables of information about types and instances of vehicle simulators. Table 2.22-141 describes the variables used by data.c.

Variables		
Variable	Туре	Where Typedef Declared
libsimStandaloneVersion	char	Standard C type.
terrainBounds	LongRect	Development:SIMNET:libmac: longpt.h
battleScheme	char	Standard C type.
mccForceID	char	Standard C type.
companyRole	array of maxNumberCompanies char	Standard C type.
simulators	array of maxVehicleSimulators SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h
pastSimulators	array of maxVehicleSimulators SavedDefaults	Development:SIMNET:MCC: libsim:libsim.h
placeDialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
detailDialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
placeBuffer	SimPlaceData	Development:SIMNET:MCC: libsim:libsim_int.h
detailBuffer	SimVehicleStatus	Development:SIMNET:MCC: include:sim_xact.h
m1PlaceDialog	extern DialogDefn	Development:SIMNET:libmac: dialog.h
m2PlaceDialog	extern DialogDefn	Development:SIMNET:libmac: dialog.h
fredPlaceDialog	extern DialogDefn	Development:SIMNET:libmac: dialog.h
simulatorTypes	array of SimulatorTypeData	Development:SIMNET:MCC: libsim:libsim_int.h

Table 2.22-141 data.c Variable Information.

2.22.2.5 fred.c

Development:SIMNET:MCC:libsim:fred.c

fred.c contains routines implementing a user interface for placing or reconstituting a SIMNET FRED (rotary wing aircraft) simulator. Table 2.22-142 describes the variables used by fred.c.

Variables		
Variable	Туре	Where Typedef Declared
fredPlaceDialog	extern DialogDefn	Development:SIMNET:libmac: dialog.h
fredFuelField	NumberFieldDefn	Development:SIMNET:libmac: dialog.h
fredAttackField	RBFieldDefn	Development:SIMNET:libmac: dialog.h
fredScoutField	RBFieldDefn	Development:SIMNET:libmac: dialog.h
fredAmmoFields	array of NumberFieldDefn	Development:SIMNET:libmac: dialog.h
fredPlaceFieldList	pointer to array of FieldDefn	Development:SIMNET:libmac: dialog.h
fredPlaceDialog	DialogDefn	Development:SIMNET:libmac: dialog.h

Table 2.22-142 fred.c Variable Information.

2.22.2.5.1 FREDSetDefaults

FREDSetDefaults sets the FRED placement fields to their default values. The function call is FREDSetDefaults(). This function calls only standard functions and is not called by any other function in this library, so no table is included for it.

2.22.2.5.2 FREDLoadSavedData

FREDLoadSavedData loads the FRED placement dialog with canned parameters. The function call is FREDLoadSavedData(company, bumper). Table 2.22-143 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
company	char	Standard C type.
bumper	char	Standard C type.
	internal Variables	-
Variable	Type	Where Typedef Declared
sim	pointer to SavedDefaults	Development:SIMNET:MCC: libsim:libsim.h
	Calls	
Function	Where Described	
FindOldSimulator	See Section 2.22.2.9.9.	
UpdateDialog	See Section 2.22.1.11.2.	

Called By		
Function	Where Described	
VehicleBumperNumber	See Section 2.22.2.9.7.	

Table 2.22-143 FREDLoadSavedData Information.

2.22.2.5.3 FREDPlaceEvent

FREDPlaceEvent is not used in the version 6.6 release.

Parameters Parameters			
Parameter	Туре	Where Typedef Declared	
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h	
itemNo	int	Standard C type.	
	Calls		
·			
Function	Where Described		
showhelp	See Section 2.22.1.19.4.		
CheckMandatoryFields	See Section 2.22.1.13.1.		
CompleteVehicleDialog	See Section 2.22.2.9.6.		

Table 2.22-144 FREDPlaceEvent Information.

2.22.2.6 load.c

Development:SIMNET:MCC:libsim:load.c

load.c contains routines for loading "canned" data into the library's data structures, to permit operation of a standalone, demo versions of the SCC and Vehicle Placement Console.

2.22.2.6.1 LoadCannedSimulators

LoadCannedSimulators loads canned simulator data, for the demo version. The parameter, company, specifies whether the simulators should be unassigned (if it is assignedNothing) or assigned to a particular company. The function call is LoadCannedSimulators(company). Table 2.22-145 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
company	int	Standard C type.
	Internal Variable	S
Variable	Туре	Where Typedef Declared
ps	register pointer to	Development:SIMNET:MCC:
	SavedDefaults	libsim:libsim.h
str	array of 50 char	Standard C type.

Table 2.22-145 LoadCannedSimulators Information.

2.22.2.7 m1.c

Development:SIMNET:MCC:libsim:m1.c

m1.c contains routines implementing a user interface for placing or reconstituting a SIMNET M1 simulator. Table 2.22-146 describes the variables used by m1.c.

Variables			
Variable	Туре	Where Typedef Declared	
m1PlaceDialog	extern DialogDefn	Development:SIMNET:libmac: dialog.h	
m1DetailDialog	extern DialogDefn	Development:SIMNET:libmac: dialog.h	
fuelLoadBuffer	int	Standard C type.	
apdsLoadBuffer	int	Standard C type.	
heatLoadBuffer	int	Standard C type.	
m1FuelField	NumberFieldDefn	Development:SIMNET:libmac: dialog.h	
m1APDSField	NumberFieldDefn	Development:SIMNET:libmac: dialog.h	
m1HEATField	NumberFieldDefn	Development:SIMNET:libmac: dialog.h	
m1MaintFields	array of RBFieldDefn	Development:SIMNET:libmac: dialog.h	
m1PlaceFieldList	pointer to array of FieldDefn	Development:SIMNET:libmac: dialog.h	
m1PlaceDialog	DialogDefn	Development:SIMNET:libmac: dialog.h	
m1TurretField	NumberFieldDefn	Development:SIMNET:libmac: dialog.h	
m1FuelFields	array of NumberFieldDefn	Development:SIMNET:libmac: dialog.h	
m1APDSFields	array of NumberFieldDefn	Development:SIMNET:libmac: dialog.h	
m1HEATFields	array of NumberFieldDefn	Development:SIMNET:libmac: dialog.h	
m1DetailFieldList	pointer to array of FieldDefn	Development:SIMNET:libmac: dialog.h	
m1DetailDialog	DialogDefn	Development:SIMNET:libmac: dialog.h	

Table 2.22-146 m1.c Variable Information.

2.22.2.7.1 M1SetDefaults

M1SetDefaults sets the M1 placement fields to their default values. The function call is M1SetDefaults(). This function calls only standard functions and is not called by any other function in this library, so no table is included for it.

2.22.2.7.2 M1LoadSavedData

M1LoadSavedData loads the M1 placement dialog with canned parameters. The function call is M1LoadSavedData(company, bumper). Table 2.22-147 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
company	char	Standard C type.
bumper	char	Standard C type.
<u> </u>	Internal Variables	<u> </u>
Variable	Туре	Where Typedef Declared
sim	pointer to SavedDefaults	Development:SIMNET:MCC: libsim:libsim.h
	Calls	
Function	Where Described	
FindOldSimulator	See Section 2.22.2.9.9.	
M1PlaceFetch	See Section 2.22.2.7.4.	
UpdateDialog	See Section 2.22.1.11.2.	
	Called By	
Function	Where Described	
ValidBumperNumber	See Section 2.22.2.9.7.	

Table 2.22-147 M1LoadSavedData Information.

2.22.2.7.3 M1FillDetail

M1FillDetail updates the detailed allocation of fuel and ammunition according to the total fuel and ammunition quantities entered. The function call is M1FillDetail(). Table 2.22-148 describes the internal variables used and functions called using this function.

	Internal Varial	bles
Variable	Туре	Where Typedef Declared
remainder1	register int	Standard C type.
remainder2	register int	Standard C type.
maximum	register int	Standard C type.
apdsChanged	int	Standard C type.
heatChanged	int	Standard C type.
	Calls	
Function	Where Described	
min	Macro defined in Dev	elopment:SIMNET:MCC:libsim:m1.c.
	Called By	
Function	Where Described	
M1PlaceEvent_	See Section 2.22.2.7	7.5.

Table 2.22-148 M1FillDetail Information.

2.22.2.7.4 M1PlaceFetch

M1PlaceFetch reads the current values of the fuel and ammo load buffers into the M1 Placement dialog to display to the user. The function call is M1PlaceFetch(dialog). Table 2.22-149 describes the parameters used by this function.

Parameters			
Parameter	Type	Where Typedef Declared	
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h	
	Called By		
Function	Where Described		
M1LoadSavedData	See Section 2.22.2.7.2.		

Table 2.22-149 M1PlaceFetch Information.

2.22.2.7.5 M1PlaceEvent

M1PlaceEvent fields events in the M1 Placement dialog. The function call is M1PlaceEvent(dialog, itemNo). Table 2.22-150 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h	
itemNo	int	Standard C type.	
	Calls		
Function	Where Described		
showhelp	See Section 2.22.1.19.4.		
CheckMandatoryFields	See Section 2.22.1.13.1.		
ShowCaution	See Section 2.22.1.4.1		
M1FillDetail	See Section 2.22.2.7.3.		
CompleteVehicleDialog	See Section 2.22.2.9.6.		
ShowDialog	See Section 2.22.1.11.1.		
ShowWindow	Standard Window Manager function for Macintosh.		

Table 2.22-150 M1PlaceEvent Information.

2.22.2.7.6 M1DetailEvent

M1DetailEvent fields events in the M1 Detail dialog. The function call is M1DetailEvent(dialog, itemNo). Table 2.22-151 describes the parameters used and functions called using this function.

Parameters			
Parameter Type Where Typedef Declare			
dialog	pointer to DialogState	Development:SIMNFT:libmac: dialog.h	
itemNo	int	Standard C type.	

Calls		
Function	Where Described	
showhelp	See Section 2.22.1.19.4.	
CheckMandatoryFields	See Section 2.22.1.13.1.	
ShowCaution	See Section 2.22.1.4.1	
M1PlaceFetch	See Section 2.22.2.7.4.	
UpdateDialog	See Section 2.22.1.11.2.	
ThrowDialog	See Section 2.22.1.11.3.	

Table 2.22-151 M1DetailEvent Information.

2.22.2.8 m2.c

Development:SIMNFT:MCC:libsim:m2.c

m2.c contains routing implementing a user interface for placing or reconstituting a SIMNET M2/3 simulator. Table 2.22-152 describes the variables used by m2.c.

Variables			
Variable	Type	Where Typedef Declared	
m2PlaceDialog	extern DialogDefn	Development:SIMNET:libmac:	
		dialog.h	
m2DetailDialog	extern DialogDefn	Development:SIMNET:libmac:	
		dialog.h	
fuelLoadBuffer	int	Standard C type.	
towLoadBuffer	int	Standard C type.

		dialog.h	
m2DetailDialog	DialogDefn	Development:SIMNET:libmac:	
		dialog.h	

Table 2.22-152 m2.c Variable Information.

2.22.2.8.1 LimitCheck

LimitCheck is used to locally check capacity limits. The function call is LimitCheck(type, value, limit, units). Table 2.22-153 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
type	pointer to char	Standard C type.
value	int	Standard C type.
limit	int	Standard C type.
units	pointer to char	Standard C type.
-	Internal Variables	
Variable	Туре	Where Typedef Declared
buf	array of 100 char	Standard C type.
	Return Values	
Return Value	Type	Meaning
0	int	Over the limits.
1	int	Within the limits.
	Calls	
Function	Where Described	
ShowCaution	See Section 2.22.1.4.1.	
· · · · · · · · · · · · · · · · · · ·	Called By	
Function	Where Described	
M2PlaceEvent	See Section 2.22.2.8.6.	
M2DetailEvent	See Section 2.22.2.8.8.	

Table 2.22-153 LimitCheck Information.

2.22.2.8.2 M2SetDefaults

M2SetDefaults sets the M2 placement fields to their default values. The function call is M2SetDefaults(). This function calls only standard functions and is not called by any other function in this library, so no table is included for it.

2.22.2.8.3 M2LoadSavedData

M2LoadSavedData loads the M2 placement dialog with canned parameters. The function call is M2LoadSavedData(company, bumper). Table 2.22-154 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
company	char	Standard C type.
bumper	char	Standard C type.

Internal Variables			
Variable	Туре	Where Typedef Declared	
sim	pointer to SavedDefaults	Development:SIMNET:MCC: libsim:libsim.h	
	Colle		
	Calls		
Function	Where Described		
FindOldSimulator	See Section 2.22.2.9.9.		
M2PlaceFetch	See Section 2.22.2.8.5.		
UpdateDialog	See Section 2.22.1.11.2.		
	Called By		
Function	Where Described		
ValidBumperNumber	See Section 2.22.2.9.7.		

Table 2.22-154 M2LoadSavedData Information.

2.22.2.8.4 M2FillDetail

M2FillDetail updates the detailed allocation of fuel and ammunition according to the total fuel and ammunition quantities entered. The function call is M2FillDetail(). Table 2.22-155 describes the internal variables used and functions called using this function.

	Internal Varial	bles
Variable	Type	Where Typedef Declared
remainder	register int	Standard C type.
· · · · · · · · · · · · · · · · · · ·		
	Calls	
Function	Where Described	
min	Macro defined in Development:SIMNET:MCC:libsim:m2.c.	
	Called By	
Function	Where Described	
M2PlaceEvent	See Section 2.22.2.8	3.6.

Table 2.22-155 M2FillDetail Information.

2.22.2.8.5 M2PlaceFetch

M2PlaceFetch reads the current values of the fuel and tow load buffers into the M2 Placement dialog to display to the user. The function call is M2PlaceFetch(dialog). Table 2.22-156 describes the parameters used by this function.

Parameters		
Parameter	Type	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h

Called By		
Function	Where Described	
M2LoadSavedData	See Section 2.22.2.8.3.	
M2DetailEvent	See Section 2.22.2.8.8.	

Table 2.22-156 M2PlaceFetch Information.

2.22.2.8.6 M2PlaceEvent

M2PlaceEvent fields events in the M2 Placement dialog. The function call is M2PlaceEvent(dialog, itemNo). Table 2.22-157 describes the parameters used and functions called using this function.

	Parameters		
Parameter	Туре	Where Typedef Declared	
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h	
itemNo	int	Standard C type.	
	Calls	 	
Function	Where Described		
showhelp	See Section 2.22.1.19.4.		
CheckMandatoryFields	See Section 2.22.1.13.1.		
LimitCheck	See Section 2.22.2.8.1.		
ShowCaution	See Section 2.22.1.4.1.		
M2FillDetail	See Section 2.22.2.8.4.		
CompleteVehicleDialog	See Section 2.22.2.9.6.		
ShowDialog	See Section 2.22.1.11.1.		
ShowWindow	Standard Window Manager function for Macintosh.		

Table 2.22-157 M2PlaceEvent Information.

2.22.2.8.7 M2DetailFetch

M2DetailFetch reads in the current stowed missile limits into the M2 Detail dialog for display to the user. The function call is M2DetailFetch(dialog). Table 2.22-158 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
str	array of 10 char	Standard C type
	Calls	
Function	Where Described	
SetStaticText	See Section 2.22.1.11.8.	

Table 2.22-158 M2DetailFetch Information.

2.22.2.8.8 M2DetailEvent

M2DetailEvent fields events in the M2 Detail dialog. The function call is M2DetailEvent(dialog, itemNo). Table 2.22-159 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h	
itemNo	int	Standard C type.	
	Calls		
Function	Where Described		
showhelp	See Section 2.22.1.19.4.		
CheckMandatoryFields	See Section 2.22.1.13.1.		
LimitCheck	See Section 2.22.2.8.1.		
ShowCaution	See Section 2.22.1.4.1.		
M2PlaceFetch	See Section 2.22.2.8.5.	See Section 2.22.2.8.5.	
UpdateDialog	See Section 2.22.1.11.2.		
ThrowDialog	See Section 2.22.1.11.3.		

Table 2.22-159 M2DetailEvent Information.

2.22.2.9 sim.c

Development:SIMNET:MCC:libsim:sim.c

sim.c contains various routines supporting dialogs for placing and reconstituting vehicle simulators. Table 2.22-160 describes the variables used by sim.c.

Variables		
Variable	Туре	Where Typedef Declared
currentSim	pointer to SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h
vehCancelField	PushButtonFieldDefn	Development:SIMNET:libmac: dialog.h
vehBumperField	NumberFieldDefn	Development:SIMNET:libmac: dialog.h
vehTeamAField	RBFieldDefn	Development:SIMNET:libmac: dialog.h
vehTeamBField	RBFieldDefn	Development:SIMNET:libmac: dialog.h
vehObserverField	RBFieldDefn	Development:SIMNET:libmac: dialog.h
vehRectField	RectFieldDefn	Development:SIMNET:libmac: dialog.h
vehLocationField	CoordinatesFieldDefn	Development:SIMNET:libmac: dialog.h
vehBowField	NumberFieldDefn	Development:SIMNET:libmac: dialog.h

Table 2.22-160 sim.c Variable Information.

2.22.2.9.1 SetUpSimulators

SetUpSimulators initializes the simulator data structures. The function call is SetUpSimulators(). Table 2.22-161 describes the internal variables used and functions called using this function.

	Internal Variable	S
Variable	Type	Where Typedef Declared
i	register int	Standard C type.
sim	register pointer to SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h
	Calls	
Function	Where Described	
NewPtr	Standard Memory Manager function for Macintosh.	
OpenResFile	Standard Resource Manager function for Macintosh.	
DeepShit	See Section 2.22.1.8.2.	
ExitToShell	Standard Segment Loader function for Macintosh.	

Table 2.22-161 SetUpSimulators Information.

2.22.2.9.2 SimulatorTypeCStr

SimulatorTypeCStr returns a C string naming a simulator type. The function call is SimulatorTypeCStr(simulatorType). Table 2.22-162 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
simulatorType	int	Standard C type.
	Return Values	3
Return Value	Туре	Meaning
simulatorTypes[simulatorType].nameCstr	pointer to char	C string naming simulator type.

Table 2.22-162 SimulatorTypeCStr Information.

2.22.2.9.3 SimulatorTypePStr

SimulatorTypePStr returns a Pascal string naming a simulator type. The function call is SimulatorTypePStr(simulatorType). Table 2.22-163 describes the parameters used by this function.

	Paramet	ers
Parameter	Type	Where Typedef Declared
simulatorType	int	Standard C type.

Return Values			
Return Value	Туре	Meaning	
simulatorTypes[simulatorType].namePstr	pointer to char	Pascal string naming simulator type.	

Table 2.22-163 SimulatorTypePStr Information.

2.22.2.9.4 CompanyName

CompanyName returns a string naming a specified company, company. This routine uses and modifies a static buffer. The string returned is only valid until the next call to CompanyName. The function call is CompanyName(company). Table 2.22-164 describes the parameters used by this function.

	Parameters	
Parameter	Type	Where Typedef Declared
company	int	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
unitString	pointer to array of char	Standard C type.
coString	pointer to char	Standard C type.
	Return Values	
Return Value	Type	Meaning
unitString[company]	pointer to char	The name of the unit
coString	pointer to char	The name of the company
	Called By	
Function	Where Described	
SimDrawCompany	Se Section 2.22.2.10.5.	

Table 2.22-164 CompanyName Information.

2.22.2.9.5 ShowVehicleDialog

ShowVehicleDialog displays a dialog for placing or reconstituting a vehicle. The function call is ShowVehicleDialog(sim, reconstFlag, completion). Table 2.22-165 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Type	Where Typedef Declared
sim	register pointer to SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h
reconstFlag	int	Standard C type.
(completion)()	void function call	Standard

Internal Variables			
Variable	Туре	Where Typedef Declared	
simData	register pointer to	Development:SIMNET:MCC:	
	SimulatorTypeData	libsim:libsim_int.h	
str	array of 10 char	Standard C type.	
tempPlaceBuffer	SimPlaceData	Development:SIMNET:MCC:	
		libsim:libsim_int.h	
	Return Values		
Return Value	Туре	Meaning	
0	int	Unsuccessful.	
1	int	Successful.	
	Calls		
Function	Where Described		
ShowCaution	See Section 2.22.1.4.1.		
DownloadVehicleParameters	See Section 2.22.2.3.3.		
ShowDialog	See Section 2.22.1.11.1.	-	
SetStaticText	See Section 2.22.1.11.8.		
LabelForceButtons	See Section 2.22.1.16.1.		

Table 2.22-165 ShowVehicleDialog Information.

2.22.2.9.6 CompleteVehicleDialog

CompleteVehicleDialog closes a dialog for placing or reconstituting a vehicle. The function call is CompleteVehicleDialog(success). Table 2.22-166 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
success	int	Standard C type.
	Internal Variables	
Variable	Туре	Where Typedef Declared
pastSim	pointer to SavedDefaults	Development:SIMNET:MCC: libsim:libsim.h
	Calls	
Function	Where Described	
UploadVehicleParameters	See Section 2.22.2.3.2.	
FindOldSimulators	See Section 2.22.2.9.9.	
NextDefaultSlot	See Section 2.22.2.9.10.	
ShowCaution	See Section 2.22.1.4.1.	
ThrowDialog	See Section 2.22.1.11.3.	
	Called By	
Function	Where Described	
FREDPlaceEvent	See Section 2.22.2.5.2.	
M1PlaceEvent	See Section 2.22.2.7.5.	
M2PlaceEvent	See Section 2.22.2.8.6.	

Table 2.22-166 Complete Vehicle Dialog Information.

2.22.2.9.7 ValidBumperNumber

ValidBumperNumber checks that a bumper number entered in a vehicle placement dialog is unique. The function call is ValidBumperNumber(dialog, fp, str). Table 2.22-167 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
fp	pointer to TypeInFieldDefn	Development:SIMNET:libmac: dialog.h
str	pointer to char	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
sim	register pointer to SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h
	register short	Standard C type.
	Detum Values	
	Return Values	
Return Value	Туре	Meaning
0	int	Another vehicle already has that bumper number.
1	int	Unique bumper number.
	Calls	
Function	Where Described	
ShowCaution	See Section 2.22.1.4.1.	
M1LoadSavedData	See Section 2.22.2.7.2.	
M2LoadSavedData	See Section 2.22.2.8.3.	
FREDLoadSavedData	See Section 2.22.2.5.2.	

Table 2.22-167 ValidBumperNumber Information.

2.22.2.9.8 LocationInExerciseArea

LocationInExerciseArea checks that a location is within the bounds of the terrain database. The function call is LocationInExerciseArea(dialog, fp,str). Table 2.22-168 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac:dialog.h
fp	pointer to TypeInFieldDefn	Development:SIMNET:libmac: dialog.h
str	pointer to char	Standard C type.

	Internal Variable	S
Variable	Туре	Where Typedef Declared
С	register pointer to MapCoordinates	Development:SIMNET:libmac: map.h
msg	аrray of 60 char	Standard C type.
	Deturn Volum	
	Return Values	
Return Value	Туре	Meaning
0	int	Location outside bounds.
1	int	Location inside bounds.
	Calls	
Function	Where Described	
ShowCaution	See Section 2.22.1.4.1.	

Table 2.22-168 LocationInExerciseArea Information.

2.22.2.9.9 FindOldSimulator

FindOldSimulator looks up a simulator by company and bumper number in the table of simulator default settings. The function call is FindOldSimulator(company, bumper, simulatorType). Table 2.22-169 describes the parameters used by this function.

Parameters		
Parameter	Туре	Where Typedef Declared
company	char	Standard C type
bumper	char	Standard C type.
simulatorType	char	Standard C type.
	Internal Variables	
Mandal I.	Internal Variables	
Variable	Туре	Where Typedef Declared
<u>i</u>	register int	Standard C type.
sim	register pointer to	Development:SIMNET:MCC:
	SavedDefaults	libsim:libsim.h
	Return Values	
Return Value	Type	Meaning
0	pointer to SavedDefaults	Simulator not found.
sim	pointer to SavedDefaults	Simulator found.
	Called By	
Function	Where Described	
FREDLoadSavedData	See Section 2.22.2.5.2.	
M1LoadSavedData	See Section 2.22.2.7.2.	
M2LoadSavedData	See Section 2.22.2.8.3.	
CompleteVehicleDialog	See Section 2.22.2.9.6.	

Table 2.22-169 FindOldSimulator Information.

2.22.2.9.10 NextDefaultSlot

NextDefaultSlot returns a pointer to the next entry for storing simulator default settings. The function call is NextDefaultSlot(). Table 2.22-170 describes the internal variables used by this function.

Internal Variables		
Variable	Туре	Where Typedef Declared
i	register int	Standard C type.
sim	register pointer to SavedDefaults	Development:SIMNET:MCC: libsim:libsim.h
	Return Values	
Return Value	Type	Meaning
0	pointer to SavedDefaults	No entry found.
sim	pointer to SavedDefaults	Next entry.
	Called By	
Function	Where Described	
CompleteVehicleDialog	See Section 2.22.2.9.6.	

Table 2.22-170 NextDefaultSlot Information.

2.22.2.10 table.c

Development:SIMNET:MCC:libsim:table.c

table.c contains routines displaying a table of vehicle simulators available for placement.

2.22.2.10.1 SimTableSetup

SimTableSetup populates a scrolling table of simulators with all those in a particular company, *company*. The function call is SimTableSetup(defn, company). Table 2.22-171 describes the parameters used and functions called using this function.

	
Туре	Where Typedef Declared
pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
unsigned char	Standard C type.
Туре	Where Typedef Declared
Internal Variables	I Where Torodot Declared
pointer to regiser	Development:SIMNET:MCC:
SimDescriptor	libsim:libsim.h
register SimListEntryHandle	Development:SIMNET:MCC: libsim:libsim_int.h
short	Standard C type.
	pointer to ScrollTableFieldDefn unsigned char Internal Variables Type pointer to regiser SimDescriptor register SimListEntryHandle

Calls		
Function	Where Described	
NewHandle	Standard Memory Manager function for Macintosh.	
InstallScrollTableEntry	See Section 2.22.1.21.1.	

Table 2.22-171 SimTableSetup Information.

2.22.2.10.2 SimTableUpdate

SimTableUpdate inserts or updates an entry in a table of simulators. The function call is SimTableUpdate(defn, sim). Table 2.22-172 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
sim	register pointer to SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
key	long	Standard C type.
entry	register ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
	Calls	
Function	Where Described	
LookupScrollTableEntry	See Section 2.22.1.24.1.	
UpdateScrollTableEntry	See Section 2.22.1.31.1.	
NewHandle	Standard Memory Manager function for Macintosh.	
InstallScrollTableEntry	See Section 2.22.1.21.1.	

Table 2.22-172 SimTableUpdate Information.

2.22.2.10.3 SimTableEntry

SimTableEntry finds the record for the simulator represented by a particular simulator table entry, *entry*. The function call is SimTableEntry(entry). Table 2.22-173 describes the parameters used by this function.

Parameters			
Parameter	Type	Where Typedef Declared	
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h	
	Return Values		
Return Value	Type	Meaning	
&simulators[((SimListEntryHan dle)entry)->sim}	pointer to SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h	

Table 2.22-173 SimTableEntry Information.

2.22.2.10.4 SimDrawBumper

SimDrawBumper fills in the fields of the bumper column in the simulator table to display to the user. The function call is SimDrawBumper(defn, col, entry, box). Table 2.22-174 describes the parameters used and functions called using this function.

	Parameters		
Parameter	Туре	Where Typedef Declared	
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h	
col	pointer to ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h	
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h	
box	pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
sim	register pointer to SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h	
str[10]	char	Standard C type.	
	Calls		
Function	Where Described		
NumToString	Standard Binary to Decimal Conversion Package function for Macintosh.		
Move	Standard Quickdraw function for Macintosh.		
StringWidth		Standard Quickdraw function for Macintosh.	
DrawString	Standard Quickdraw function for Macintosh.		

Table 2.22-174 SimDrawBumper Information.

2.22.2.10.5 SimDrawCompany

SimDrawCompany fills in the fields of the company column in the simulator table to display to the user. The function call is SimDrawCompany(defn, col, entry, box). Table 2.22-175 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
col	pointer to ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
box	pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h

	Internal Variables	
Variable	Туре	Where Typedef Declared
sim	register pointer to SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h
ср	register pointer to char	Standard C type.
	Calls	
Function	Where Described	
CompanyName	See Section 2.22.2.9.4.	
DrawText	Standard Quickdraw function for Macintosh.	

Table 2.22-175 SimDrawCompany Information.

2.22.2.10.6 SimDrawLocation

SimDrawLocation fills in the fields of the location column in the simulator table to display to the user. The function call is SimDrawLocation(defn, col, entry, box). Table 2.22-176 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
col	pointer to ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
box	pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h
	Internal Variables	
Variable	Type	Where Typedef Declared
sim	register pointer to SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h
	Calls	
Function	Where Described	
DrawText	Standard Quickdraw functio	n for Macintosh.

Table 2.22-176 SimDrawLocation Information.

2.22.2.10.7 SimDrawPlaced

SimDrawPlaced fills in the fields of the placed column in the simulator table to display to the user. The function call is SimDrawPlaced(defn, col, entry, box). Table 2.22-177 describes the parameters used and functions called using this function.

<u> </u>	Parameters		
Parameter	Туре	Where Typedef Declared	
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h	
col	pointer to ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h	
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h	
box	pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h	
	Internal Variables		
Variable	Type	Where Typedef Declared	
sim	register pointer to SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h	
•			
	Calls		
Function	Where Described		
Move	Standard Quickdraw functio	n for Macintosh.	
StringWidth	Standard Quickdraw functio		
DrawString	Standard Quickdraw functio	n for Macintosh.	

Table 2.22-177 SimDrawPlaced Information.

2.22.2.10.8 SimDrawSide

SimDrawSide fills in the fields of the side column in the simulator table to display to the user. The function call is SimDrawSide(defn, col, entry, box). Table 2.22-178 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
col	pointer to ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
box	pointer to Rect	Development:THINK C: Mac #includes:macTypes.h
	internal Variables	
Variable	Туре	Where Typedef Declared
sim	register pointer to SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h
	Calls	
Function	Where Described	
DrawString	Standard Quickdraw function	n for Macintosh.
ForceNamePStr	See Section 2.22.1.16.2.	

Table 2.22-178 SimDrawSide Information.

2.22.2.10.9 SimDrawSimulator

SimDrawSimulator fills in the fields of the simulator column in the simulator table to display to the user. The function call is SimDrawSimulator(defn, col, entry, box). Table 2.22-179 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
col	pointer to ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
box	pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h
	Internal Variables	
Variable	Type	Where Typedef Declared
sim	register pointer to SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h
str[10]	char	Standard C type.
	Calls	
Function	Where Described	
NumToString	Standard Binary to Decimal Conversion Package function for Macintosh.	
Move	Standard Quickdraw function for Macintosh.	
StringWidth	Standard Quickdraw functio	n for Macintosh.
DrawString	Standard Quickdraw functio	n for Macintosh.
DrawChar	Standard Quickdraw functio	

Table 2.22-179 SimDrawSimulator Information.

2.22.2.10.10 SimDrawType

SimDrawType fills in the fields of the type column in the simulator table to display to the user. The function call is SimDrawType(defn, col, entry, box). Table 2.22-180 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
col	pointer to ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
box	pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h

	internal Variable	s
Variable	Туре	Where Typedef Declared
sim	register pointer to SimDescriptor	Development:SIMNET:MCC: libsim:libsim.h
	Calls	
Function	Where Described	
DrawString	Standard Quickdraw fund	ction for Macintosh.

Table 2.22-180 SimDrawType Information.

2.22.2.11 Sim Pictures

Sim Pictures contains resources that determine the appearance of the user interface presented for placing and reconstituting vehicle simulators.

2.22.2.12 resource.h

Development:SIMNET:MCC:libsim:resource.h

resource.h defines the numbers of the resources present in the Sim Pictures resource file.

2.22.3 libsupply

Folder: "Development:SIMNET:MCC:libsupply"

This folder contains a library of C definitions representing the characteristics of various kinds of ammunition known to the MCC system. The library is used by both the SCC and Admin/Log Macintosh applications. The library is composed from the following files:

2.22.3.1 libsupply.h

Development:SIMNET:MCC:libsupply:libsupply.h

libsupply.h defines the external interface to the libsupply library. Table 2.22-181 describes the variables used by libsupply.h.

Variables		
Variable	Туре	Where Typedef Declared
ammoCharacteristics	extern array of AmmoCharacteristics	Development:SIMNET:MCC: libsupply:libsupply.h
ammoTableColumns	extern array of ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h

Table 2.22-181 libsupply.h Variable Information.

2.22.3.2 data.c

Development:SIMNET:MCC:libsupply:data.c

data.c defines a table containing the name, weight and volume of each type of ammunition. Table 2.22-182 describes the variables used by data.c.

Variables		
Variable	Туре	Where Typedef Declared
ammoCharacteristics	array of[numberAmmoVarieties AmmoCharacteristics	Development:SIMNET:MCC: libsupply:libsupply.h

Table 2.22-182 data.c Variable Information.

2.22.3.3 version.h

Development:SIMNET:MCC:libsupply:version.h

version.h defines a constant determining whether the libsupply library is compiled to represent the characteristics of US or Soviet ammunition.

2.22.3.4 transfer.c

Development:SIMNET:MCC:libsupply:transfer.c

transfer.c implements a dialog for transferring ammunition between one truck or stockpile and another. Table 2.22-183 describes the variables used by transfer.c.

Variables		
Variable	Туре	Where Typedef Declared
parties	array of 2 TransferParty	Development:SIMNET:MCC: libsupply:libsupply.h
(completionCallback)()	void function call	Standard
transferQuantity	int	Standard C type.
direction	char	Standard C type.
transferAmmoArrowBtns	array of 2 RBFieldDefn	Development:SIMNET:libmac: dialog.h
transferAmmoOKBtn	staticPushButtonFieldDefn	Development:SIMNET:libmac: dialog.h
transferAmmoTransferBtn	staticPushButtonFieldDefn	Development:SIMNET:libmac: dialog.h
transferAmmoQuantityField	NumberFieldDefn	Development:SIMNET:libmac: dialog.h
transferAmmoTables	array of 2 ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
transferAmmoFieldList	pointer to array of FieldDefn	Development:SIMNET:libmac: dialog.h
transferAmmoDialog	DialogDefn	Development:SIMNET:libmac: dialog.h

Table 2.22-183 transfer.c Variable Information.

2.22.3.4.1 ShowTransferAmmoDialog

ShowTransferAmmoDialog puts up a dialog for transferring ammunition. The function call is ShowTransferAmmoDialog(dialog, resourceID, leftParty, rightParty, callback). Table 2.22-184 describes the parameters used and functions called using this function.

	Parameters Parameters Parameters	
Parameter	Туре	Where Typedef Declared
dialog	Ptr	Development:THINK C: Mac #includes:MacTypes.h
resourceID	int	Standard C type.
leftParty	pointer to TransferParty	Development:SIMNET:MCC: libsupply:libsupply.h
rightParty	pointer to TransferParty	Development:SIMNET:MCC: libsupply:libsupply.h
(callback)()	void function call	Standard
	Return Values	
Return Value	Туре	Meaning
(DialogState) dialog	pointer to DialogState	Ammo transfer dialog.
	Calls	- T
Function	Where Described	
ShowDialog	See Section 2.22.1.11.1.	
SellText	Standard Dialog Manager for	unction for Macintosh.

Table 2.22-184 ShowTransferAmmoDialog Information.

2.22.3.4.2 TransferAmmoFetch

TransferAmmoFetch loads values into an ammo transfer dialog, dialog. The function call is TransferAmmoFetch(dialog). Table 2.22-185 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
weight	long	Standard C type.
volume	long	Standard C type.
theType	int	Standard C type.
theltem	Handle	Development:THINK C: Mac #includes:MacTypes.h
rect	Rect	Development:THINK C: Mac #includes:MacTypes.h

Calls		
Function	Where Described	
SetStaticText	See Section 2.22.1.11.8.	
UpdateTransferAmmoLoads	See Section 2.22.3.4.4.	

Table 2.22-185 TransferAmmoFetch Information.

2.22.3.4.3 TransferAmmoEvent

TransferAmmoEvent fields an event in a transfer ammo dialog. The function call is TransferAmmoEvent(dialog, itemNo). Table 2.22-186 describes the parameters used and functions called using this function.

Parameters			
Parameter	Туре	Where Typedef Declared	
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h	
itemNo	int	Standard C type.	
	Internal Variables		
Variable	Туре	Where Typedef Declared	
party	register pointer to TransferParty	Development:SIMNET:MCC: libsupply:libsupply.h	
ammoType	register short	Standard C type.	
weight	long	Standard C type.	
volume	long	Standard C type	
str	array of 100 char	Standard C type.	
savePort	GrafPtr	Development:THINK C: Mac #includes:Quickdraw.h	
theType	int	Standard C type.	
theltem	Handle	Development:THINK C: Mac #includes:MacTypes.h	
rect	Rect	Development:THINK C: Mac #includes:MacTypes.h	
Return Values			
Return Value	Type	Meaning	
0	int	Unsuccessful.	
itemNo	int		

Calls		
Function	Where Described	
SellText	Standard Dialog Manager function for Macintosh.	
ShowCaution	See Section 2.22.1.4.1.	
TotalAmmoCapacity	See Section 2.22.3.9.1.	
TransferBetweenAmmoLists	See Section 2.22.3.5.11.	
EnableControl	See Section 2.22.1.7.2.	
DisableControl	See Section 2.22.1.7.1.	
SetRadioButton	See Section 2.22.1.11.6.	
UpdateCapacityDisplay	See Section 2.22.3.4.5.	
DisposeScrollTable	See Section 2.22.1.30.2.	
ThrowDialog	See Section 2.22.1.11.3.	

Table 2.22-186 TransferAmmoEvent Information.

2.22.3.4.4 UpdateTransferAmmoLoads

UpdateTransferAmmoLoads updates the display of the loads on board the two parties. The function call is UpdateTransferAmmoLoads(dialog). Table 2.22-187 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
	Calls	
Function	Where Described	
EmptyScrollTable	See Section 2.22.1.28.2.	
FillAmmunitionList	See Section 2.22.3.5.1.	
SetScrollTableSelection	See Section 2.22.1.37.2.	
EnableControl	See Section 2.22.1.7.2.	
DisableControl	See Section 2.22.1.7.1.	
SetRadioButton	See Section 2.22.1.11.6.	
UpdateCapacityDisplay	See Section 2.22.3.4.5.	
	Called By	
Function	Where Described	
TransferAmmoFetch	See Section 2.22.3.4.2.	

Table 2.22-187 UpdateTransferAmmoLoads Information.

2.22.3.4.5 UpdateCapacityDisplay

UpdateCapacityDisplay updates the display of the weight and volume of ammunition on board the two parties. The function call is UpdateCapacityDisplay(dialog). Table 2.22-188 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
dialog	pointer to DialogState	Development:SIMNET:libmac: dialog.h
	internal Variables	
Variable	Type	Where Typedef Declared
party	register pointer to TransferParty	Development:SIMNET:MCC: libsupply:libsupply.h
i	register short	Standard C type.
weight	long	Standard C type.
volume	long	Standard C type.
weightString	array of 50 char	Standard C type.
volumeString	array of 50 char	Standard C type.
	Calls	
Function	Where Described	
TotalAmmoCapacity	See Section 2.22.3.9.1.	
SetStaticText	See Section 2.22.1.11.8.	
	Called By	
Function	Where Described	
TransferAmmoEvent	See Section 2.22.3.4.3.	
UpdateTransferAmmoLoads	See Section 2.22.3.4.4.	

Table 2.22-188 UpdateCapacityDisplay Information.

2.22.3.5 ammolist.c

Development:SIMNET:MCC:libsupply:ammolist.c

ammolist.c implements the scrolling lists of ammunition types and quantities. Table 2.22-189 describes the variables used by ammolist.c.

Variables		
Variable Type Where Typedef Declared		
ammoTableColumns	array of numberAmmoTableColumns ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h

Table 2.22-189 ammolist.c Variable Information.

2.22.3.5.1 FillAmmunitionList

FillAmmunitionList populates a scrolling list of ammunition quantities from a manifest, manifest. The function call is FillAmmunitionList(defn, manifest). Table 2.22-190 describes the parameters used and functions called using this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
manifest	Manifest	Development:SIMNET:MCC: include:resupply.h
	Internal Variables	
Variable	Type	Where Typedef Declared
i	register short	Standard C type.
weight	long	Standard C type.
volume	long	Standard C type.
entry	AmmoListEntryHandle	Development:SIMNET:MCC: libsupply:libsupply:h
	Calls	
Function	Where Described	
NewAmmoListEntry	See Section 2.22.3.5.2.	****
InstallAmmoEntry	See Section 2.22.3.5.3.	
	Called By	
Function	Where Described	
UpdateTransferAmmoLoads	See Section 2.22.3.4.4.	

Table 2.22-190 FillAmmunitionList Information.

2.22.3.5.2 NewAmmoListEntry

NewAmmoListEntry allocates a new entry for a scrolling list of ammunition quantities. The function call is NewAmmoListEntry(type, quantity, weight, volume). Table 2.22-191 describes the parameters used and functions called using this function.

	Parameters	- · · · · · · · · · · · · · · · · · · ·
Parameter	Туре	Where Typedef Declared
type	short	Standard C type.
quantity	short	Standard C type.
weight	long	Standard C type.
volume	long	Standard C type.
	internal Variables	
Variable	Type	Where Typedef Declared
ammo	register AmmoListEntryHandle	Development:SIMNET:MCC: libsupply:libsupply.h

	Return Values	
Return Value	Туре	Meaning
ammo	AmmoListEntryHandle	New ammo list entry.
	Calls	
Function	Where Described	
NewHandle	Standard Memory Manager function for Macintosh.	
	Called By	
Function	Where Described	
FillAmmunitionList	See Section 2.22.3.5.1.	
TransferAmmoBetweenLists	See Section 2.22.3.5.11.	
UpdateAmmoList	See Section 2.22.3.5.12.	

Table 2.22-191 NewAmmoListEntry Information.

2.22.3.5.3 InstallAmmoEntry

InstallAmmoEntry installs a new entry into a scrolling list of ammuniton quantities. The function call is InstallAmmoEntry(ammo, defn). Table 2.22-192 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
ammo	AmmoListEntryHandle	Development:SIMNET:MCC: libsupply:libsupply.h
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
	Calls	
Function	Where Described	
InstallScrollTableEntry	See Section 2.22.1.21.1.	
	Called By	
Function	Where Described	
FillAmmunitionList	See Section 2.22.3.5.1.	
TransferAmmoBetweenLists	See Section 2.22.3.5.11.	
UpdateAmmoList	See Section 2.22.3.5.12.	

Table 2.22-192 InstallAmmoEntry Information.

2.22.3.5.4 RemoveAmmoEntry

RemoveAmmoEntry removes an entry, *entry*, from a scrolling list of ammunition quantities. The function call is RemoveAmmoEntry(entry, defn). Table 2.22-193 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
entry	AmmoListEntryHandle	Development:SIMNET:MCC: libsupply:libsupply.h
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
h	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
	Calls	
Function	Where Described	
ScrollToShow	See Section 2.22.1.35.1.	
SetScrollTableSelection	See Section 2.22.1.37.2.	
RemoveScrollTableEntry	See Section 2.22.1.28.1.	
	Called By	
Function	Where Described	
TransferAmmoBetweenLists	See Section 2.22.3.5.11.	

Table 2.22-193 RemoveAmmoEntry Information.

2.22.3.5.5 SelectAmmoEntry

SelectAmmoEntry is called on a mouse click in a scrolling list of ammunition quantities. The function call is SelectAmmoEntry(defn, row, rect, theEvent). Table 2.22-194 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
row	int	Standard C type.
rect	pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h
theEvent	pointr to EventRecord	Development:THINK C: Mac #includes:EventMgr.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
	Calls	
Function	Where Described	
ScrollTableRowToEntry	See Section 2.22.1.34.1.	
SetScrollTableSelection	See Section 2.22.1.37.2.	

Table 2.22-194 SelectAmmoEntry Information.

2.22.3.5.6 AmmoDrawName

AmmoDrawName draws the ammo type column. The function call is AmmoDrawName(defn, col, entry, box). Table 2.22-195 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
col	pointer to ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
box	pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h
	Internal Variables	
Variable	Туре	Where Typedef Declared
ср	pointer to char	Standard C type.
	Calls	
Function	Where Described	
DrawString	Standard Quickdraw function for Macintosh.	

Table 2.22-195 AmmoDrawName Information.

2.22.3.5.7 AmmoDrawNumber

AmmoDrawNumber draws a numeric value in an ammo list. The function call is AmmoDrawNumber(col, quantity, n). Table 2.22-196 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
col	pointer to ScrollTableColumnDefn	Development SIMNET:libmac. scroll.h
quantity	int	Standard C type.
n	long	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
string	array of 20 char	Standard C type.

Calls		
Function	Where Described	
Move	Standard Quickdraw function for Macintosh.	
DrawString	Standard Quickdraw function for Macintosh.	
NumToString	Standard Binary to Decimal Conversion Package function for Macintosh.	
	Called By	
Function	Where Described	
AmmoDrawQuantity	See Section 2.22.3.5.8.	
AmmoDrawWeight	See Section 2.22.3.5.9.	
AmmoDrawVolume	See Section 2.22.3.5.10.	

Table 2.22-196 AmmoDrawNumber Information.

2.22.3.5.8 AmmoDrawQuantity

AmmoDrawQuantity is the ammo quantity column draw function. The function call is AmmoDrawQuantity(defn, col, entry, box). Table 2.22-197 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
col	pointer to ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
box	pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h
	0.11	
	Calls	
Function	Where Described	
AmmoDrawNumber	See Section 2.22.3.5.7.	

Table 2.22-197 AmmoDrawQuantity Information.

2.22.3.5.9 AmmoDrawWeight

AmmoDrawWeight is the ammo weight column draw function. The function call is AmmoDrawWeight(defn, col, entry, box). Table 2.22-198 describes the parameters used and functions called using this function.

Parameters Parameters		
Parameter	Туре	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
col	pointer to ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
box	pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h
	Calls	
Function	Where Described	
AmmoDrawNumber	See Section 2.22.3.5.7.	

Table 2.22-198 AmmoDrawWeight Information.

2.22.3.5.10 AmmoDrawVolume

AmmoDrawVolume is the ammo volume column draw function. The function call is AmmoDrawVolume(defn, col, entry, box). Table 2.22-199 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
defn	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
col	pointer to ScrollTableColumnDefn	Development:SIMNET:libmac: scroll.h
entry	ScrollTableEntryHandle	Development:SIMNET:libmac: scroll.h
box	pointer to Rect	Development:THINK C: Mac #includes:MacTypes.h
	Calls	
Function	Where Described	
AmmoDrawNumber	See Section 2.22.3.5.7.	

Table 2.22-199 AmmoDrawVolume Information.

2.22.3.5.11 TransferAmmoBetweenLists

TransferAmmoBetweenLists moves a quantity, quantity, of ammunition, type, from one list to another, fromTable andtoTable. The function call is TransferAmmoBetweenLists(fromTable, toTable, type, quantity). Table 2.22-200 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
fromTable	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
toTable	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h
type	int	Standard C type.
quantity	int	Standard C type.
	Internal Variables	
Variable	Type	Where Typedef Declared
ammoChar	pointer to AmmoCharacteristics	Development:SIMNET:MCC: libsupply:libsupply.h
entry	register AmmoListEntryHandle	Development:SIMNET:MCC: libsupply:libsupply.h
weight	long	Standard C type.
volume	long	Standard C type.
	Calls	
Function	Where Described	
LookupScrollTableEntry	See Section 2.22.1.24.1.	
UpdateScrollTableEntry	See Section 2.22.1.31.1.	
RemoveAmmoEntry	See Section 2.22.3.5.4.	
NewAmmoListEntry	See Section 2.22.3.5.2.	
InstallAmmoEntry	See Section 2.22.3.5.3.	
ScrollToShow	See Section 2.22.1.35.1.	
SetScrollTableSelection	See Section 2.22.1.37.2.	
	Called By	
Function	Where Described	
TransferAmmoEvent	See Section 2.22.3.4.3.	

Table 2.22-200 TransferAmmoBetweenLists Information.

2.22.3.5.12 UpdateAmmoList

UpdateAmmoList updates an ammo list to match the contents of a manifest, manifest. The function call is UpdateAmmoList(manifest, table). Table 2.22-201 describes the parameters used and functions called using this function.

Parameters		
Parameter	Type	Where Typedef Declared
manifest	pointer to Manifest	Development:SIMNET:MCC: include:resupply.h
table	pointer to ScrollTableFieldDefn	Development:SIMNET:libmac: scroll.h

Internal Variables		
Variable	Туре	Where Typedef Declared
i	register short	Standard C type.
entry	register AmmoListEntryHandle	Development:SIMNET:MCC: libsupply:libsupply.h
n	int	Standard C type.
weight	long	Standard C type.
volume	long	Standard C type.
	Calls	
Function	Where Described	
LookupScrollTableEntry	See Section 2.22.1.24.1.	
UpdateScrollTableEntry	See Section 2.22.1.31.1.	
RemoveScrollTableEntry	See Section 2.22.1.28.1.	
NewAmmoListEntry	See Section 2.22.3.5.2.	
InstallAmmoEntry	See Section 2.22.3.5.3.	

Table 2.22-201 UpdateAmmoList Information.

2.22.3.6 libsupply int.h

Development:SIMNET:MCC:libsupply:libsupply_int.h

libsupply_int.h supplies defintions internal to the libsupply library.

2.22.3.7 summary.c

Development:SIMNET:MCC:libsupply:summary.c

summary.c contains a routine which displays a summary of the load onboard a truck.

2.22.3.7.1 DisplayAmmoLoadSummary

DisplayAmmoLoadSummary displays a summary of the load aboard an ammo truck. The function call is DisplayAmmoLoadSummary(manifest, rect, byAmmoType). Table 2.22-202 describes the parameters used and functions called using this function.

Parameters		
Parameter	Туре	Where Typedef Declared
manifest	register pointer to Manifest	Development:SIMNET:MCC: include:resupply.h
rect	pointer to Rect	Development:TiHINK C: Mac #includes:MacTypes.h
byAmmoType	int	Standard C type.
······································	Internal Variables	
Variable	Туре	Where Typedef Declared
string	array of char	Standard C type.
string weight	array of char long	Standard C type. Standard C type.
weight	long	Standard C type.

Calls		
Function	Where Described	
APPEND	Macro defined in Development:SIMNET:MCC:libsupply:summary.c.	
DrawString	Standard Quickdraw function for Macintosh.	
TotalAmmoCapacity	See Section 2.22.3.9.1.	
MoveTo	Standard Quickdraw function for Macintosh.	
StringWidth	Standard Quickdraw function for Macintosh.	
PenPat	Standard Quickdraw function for Macintosh.	
Line	Standard Quickdraw function for Macintosh.	

Table 2.22-202 DisplayAmmoLoadSummary Information.

2.22.3.8 supply_version.h Development:SIMNET:MCC:libsupply:supply_version.h

supply_version.h defines the version of the libsupply library to be compiled.

2.22.3.9 supply.c

Development:SIMNET:MCC:libsupply:supply.c

supply.c contains a routine related to the supply trucks.

2.22.3.9.1 TotalAmmoCapacity

TotalAmmoCapacity sums the weight and volume of a load of ammunition. The function call is TotalAmmoCapacity(manifest, weight, volume). Table 2.22-203 describes the parameters used by this function.

	Parameters	
Parameter	Туре	Where Typedef Declared
manifest	pointer to Manifest	Development:SIMNET:MCC: include:resupply.h
weight	pointer to long	Standard C type.
volume	pointer to long	Standard C type.
-		
	Internal Variables	
Variable	Туре	Where Typedef Declared
	register short	Standard C type.
n	register int	Standard C type.
-		
	Called By	
Function	Where Described	
TransferAmmoEvent	See Section 2.22.3.4.3.	
UpdateCapacityDisplay	See Section 2.22.3.4.5.	
DisplayAmmoLoadSummary	See Section 2.22.3.7.1.	

Table 2.22-203 Total Ammo Capacity Information.

2.22.4 Top-level Includes

Folder: "Development:SIMNET:include"

This folder contains C header files shared across various SIMNET Macintosh libraries and applications. They match header files of the same names found in the /simnet/include and/simnet/include/ protocol directories of MCC host software. These header files are:

2.22.4.1 basic.h

Development:SIMNET:include:basic.h

basic.h defines various types and constants used in the representation of SIMNET protocol data units.

2.22.4.2 battles.h

Development:SIMNET:include:battles.h

battles.h defines constants used to identify various kinds of battle schemes.

2.22.4.3 repair.h

Development:SIMNET:include:repair.h

repair.h defines constants for the various types of repairs simulated by the MCC system.

2.22.4.4 obj type.h

Development: SIMNET:include:obj_type.h

obj_type.h defines constants used in SIMNET protocol data units to represent various types of simulated objects.

2.22.4.5 veh role.h

Development:SIMNET:include:veh_role.h

veh_role.h defines constants for the various roles that can be served by a vehicle that the MCC system controls or simulates.

2.22.4.6 veh type.h

Development:SIMNET:include:veh_type.h

veh_type.h defines constants used in SIMNET protocol data units to represent various types of vehicles.

2.22.4.7 address.h

Development:SIMNET:include:address.h

address.h defines constants associated with addressing the simulator sites.

2.22.4.6 repair m1.h

Development:SIMNET:include:repair_m1.h

repair_m1.h defines the codes for various repairs simulated by the SIMNET M1 simulator.

2.22.4.6 repair m2.h

Development:SIMNET:include:repair_m2.h

repair_m2.h defines the codes for various repairs simulated by the SIMNET M2 simulator.

File: "Development:SIMNET:SIMNET Resources"

This resource file contains various resources required by routines in the library, such as definitions for the dialog boxes displayed by the caution and help routines.

Folder: "Development:SIMNET:Icon Button"

This folder contains source code implementing an "icon button" control, which behaves like a radio button or check box, but appears as an icon with an associated text label. This code is compiled to produce a CDEF code resource, which is then copied into the "SIMNET Resources" resource file.

Folder: "Development:SIMNET:MCC"

This folder forms the root of the hierarchy of folders containing SIMNET MCC software for the Macintosh.

2.22.5 MCC Includes

Folder: "Development:SIMNET:MCC:include"

This folder contains C header files shared across various SIMNET MCC Macintosh applications. They match header files of the same names found in the /simnet/mcc/include directory of MCC host software. These header files are:

2.22.5.1 ammo.h

Development:SIMNET:MCC:include:ammo.h

ammo.h defines constants for the various kinds of ammunition known to the MCC system.

2.22.5.2 arty.h

Development:SIMNET:MCC:include:arty.h

arty.h defines constants associated with the MCC system's artillery simulation.

2.22.5.3 console.h

Development:SIMNET:MCC:include:console.h

console.h contains definitions related to AppleTalk communication between the MCC host and its Macintosh consoles. Table 2.22-204 describes the variables used by console.h.

Variables		
Variable	Туре	Where Typedef Declared
hostSocket	extern int	Standard C type.

Table 2.22-204 console.h Variable Information.

2.22.5.4 MCC limits.h

Development:SIMNET:MCC:include:MCC_limits.h

MCC_limits.h defines various limits of the MCC system (e.g., the capacity of a fuel or ammunition supply truck).

2.22.5.5 options.h

Development:SIMNET:MCC:include:options.h

options.h defines a structure for representing the presence of various optional elements that the MCC system may simulate.

2.22.5.6 manifest.h

Development:SIMNET:MCC:include:manifest.h

manifest.h defines a structure for representing quantities of various kinds of ammunition and fuel.

2.22.5.7 sim xact.h

Development:SIMNET:MCC:include:sim_xact.h

sim_xact.h defines AppleTalk communication, between the MCC host and its Macintosh consoles, for the allocation, placement and reconstitution of vehicle simulators.

2.22.5.8 fleet type.h

Development:SIMNET:MCC:include:fleet_type.h

fleet_type.h defines the contstants distinguishing the various truck fleets simulated by the MCC system.

2.22.5.9 resupply.h

Development:SIMNET:MCC:include:resupply.h

resupply.h contains definitions associated with the MCC system's simulation of resupply trucks.

2.22.5.10 veh assign.h

Development:SIMNET:MCC:include:veh_assign.h

veh_assign.h defines constants representing the organizational units to which a vehicle may be assigned.
